

A 16 year old female presented with history of decreased urine output and facial puffiness of 3 days duration. On examination her BP was 180/110mmHg. She gives history of being treated for scabies associated skin infection one week prior to this.

Her urine report is as follows :

Colour , smoky  
RBC's – 20-35 cells/HPF  
WBC - 4 – 6 cells/HPF  
RBC casts are seen  
Albumin (+)

- a) What is your diagnosis ?
- b) What is the pathology in this disorder?
- c) What are the complications of the disease?
