

WBCs / Leukocytes

Learning Objectives

- Introduction to WBCs
- Myelopoiesis & its steps
- Neutrophil characteristics
- Inflammation and signs of inflammation
- Role of Neutrophil in inflammation/infection
- Causes of Neutrophil number variation

Introduction – WBCs / Leukocytes

Human body is exposed to a number of, diseases causing microbes all the time and but body is equipped with the **White blood cells** to safeguards from these microbes.

We can say that WBCs are mobile units of body's protective mechanisms (IMMUNITY).

Peripheral blood - WBC count= 4000-11000/mm³, Life span 4-8 hours in bloodstream Tissue life span estimated at 4-5 days.

Normal range of WBCs / Leukocytes

■ Total Leukocytes Count (TLC)		4000–11,000/mm ³
Differential Leukocytes Count (DLC)		
	<u>Absolute value</u>	<u>% value</u>
Neutrophils	3000-6000	50-70
Eosinophils	150-300	1-4
Basophils	01–100	0.4
Lymphocytes	1500–4000	20-40
Monocytes	300-600 www.FirstRanker.com	2-8

Introduction – WBCs / Leukocytes

WBCs - concerned with non specific immunity- **Granulocytes** and **Monocytes**.

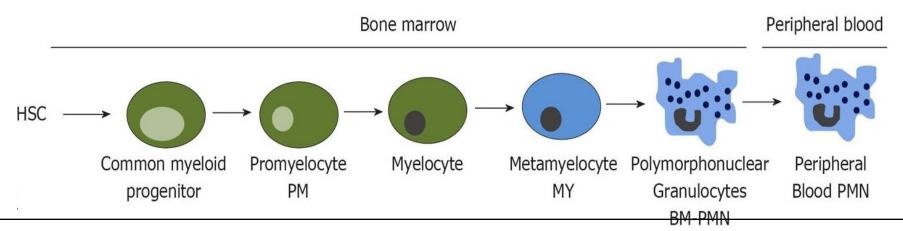

- Neutrophils
- Eosinophils
- Basophils

WBCs - concerned with specific immunity - Lymphocytes

Myelopoiesis

Myeloid Stem Cells \rightarrow CFU-GM \rightarrow Myeloblast \rightarrow Promyelocyte \downarrow Polymorphonuclear \leftarrow Band form \leftarrow Metamyelocyte \leftarrow Myelocyte

Neutrophil

- Most Numerous of all leukocytes : 50 70%
- Diameter: 10 14 μ
- The Cytoplasm contains closely packed, fine and violet-pink granules
- Barr Body —

- The Nucleus can have 1 6
- Function- Neutrophil can cause effective 'Phagocytosis' –to
 kill foreign particles and microbes.

Form first line of defense.

Neutrophil

Granules contents (biologically active substances) –

Neutrophil - Role in Inflammation / Phagocytosis

Neutrophil blood cells are very important in combating **acute inflammation** in body by the process of

'leukocytes adhesion cascade' reaction i.e.:

Margination,

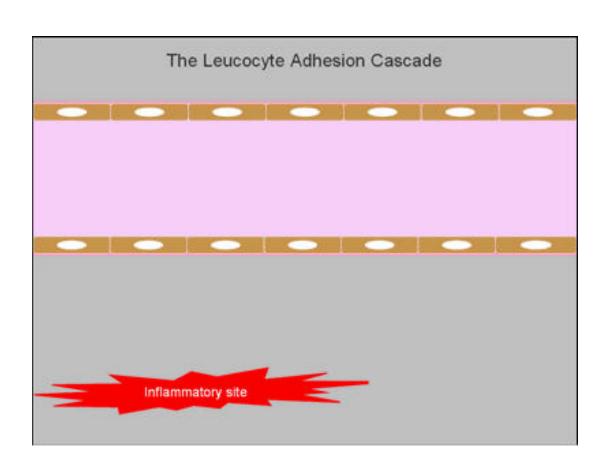

Rolling,

Adhesion,

Diapedesis

Chemotaxis and

Phagocytosis

Inflammation and Signs of inflammation

The five cardinal signs of inflammation—

Redness (rubor)

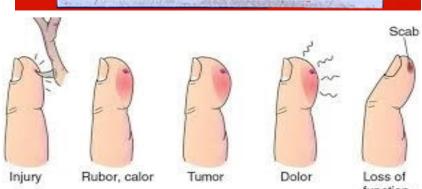

Heat (calor)

Swelling (tumor)

Pain (dolor)—were described by Cornelius Celsus.

A fifth consequence of inflammation is the **loss of function** of the inflamed area, **Rudolf Virchow**

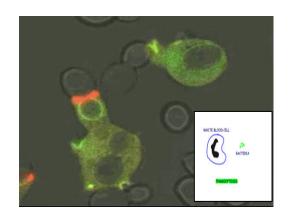

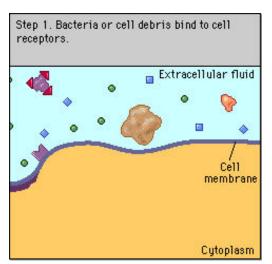

Neutrophil- Role in Inflammation / Phagocytosis

Phagocytosis- Phagesis: to eat, Cytos: cells 'Process of ingestion and destroying of foreign microbes/antigens'

Endocytosis-Taking in Microbes and cell debris Formation of Phagosome ↓ lysosome Phagolysosome

Neutrophil- Causes of variation in Number

Neutrophilia: Increase in neutrophil=>12000/mm³

Causes-

Neutropenia: Decrease in neutrophils= <2000/mm³

Causes-

Neutrophil-Leukemia

Leukaemia, is a malignant neoplasm that involve HSC in the bone marrow and results in formation of high numbers of abnormal nonfunctional white blood cells (>1 Lac/mm3). These white blood cells are not fully developed and are called blasts or **leukemia** cells.

Self Assessment

Normal WBC count is/mm ³
Steps of Myelopoiesis: → CFU-GM → Promyelocyte→ → Metamyelocyte → Mature form.
30% neutrophil cell nuclei of female contains a small, densely staining structure, consisting of a condensed inactiveknown as
Name 3 important granules contents of neutrophil (biologically active substances)–
'leukocytes adhesion cascade' reactions include
The inflammatory response involves three major stages: first,to increase blood flow; second,at the site of injury.
The five cardinal signs of inflammation are
Name 6 important Released chemokines from with interestablished to mediate inflammation –
