R09

B.Tech III Year II Semester (R09) Supplementary Examinations May/June 2016 TRANSPORTATION ENGINEERING

(A) III LIONE

(Civil Engineering)

Time: 3 hours Max. Marks: 70

Answer any FIVE questions All questions carry equal marks

- 1 (a) What are the significant recommendations of Jayakar committee? Mention how these recommendations helped in road development in India.
 - (b) Explain the salient features of Nagpur road development plan.
- 2 (a) Define Super elevation. Derive an expression for computing the rate of super elevation for a road section on a horizontal curve analyzing the various forces acting on the vehicle moving on the curve.
 - (b) Calculate the rate of super elevation to be provided at a horizontal curve of radius 400 m on a plain terrain for a design speed of 100 kmph. Is there a need for restricting the super elevation? If so, what is the restricted super elevation rate and find out whether there is need to restrict the speed or not.
- 3 (a) What are the possible causes for accidents? Explain.
 - (b) What kind of data is collected in accident studies? Discuss.
- What are the studies to be done to collect the required data while designing the traffic signal at an intersection? Explain. Also discuss the important design components in a traffic signal control.
- 5 Draw a neat sketch of a full cloverleaf and show the movement of traffic.
- 6 (a) What are the different types of pavements? Explain the differences between them.
 - (b) Explain about the components of a pavement structure and their functions.
- 7 (a) Draw a neat sketch of an aero plane and explain its various component parts.
 - (b) Discuss about various components of aircraft weight.
- The length of a runway under standard conditions is 1700 m. The airport site has an elevation of 280 m and its reference temperature is 34.5°C. If the runway is to be constructed with an effective gradient of 0.20 percent, determine the corrected runway length.
