

I Year - II Semester**MATHEMATICS-III****Course Objectives:**

1. The course is designed to equip the students with the necessary mathematical skills and techniques that are essential for an engineering course.
2. The skills derived from the course will help the student from a necessary base to develop analytic and design concepts.
3. Understand the most basic numerical methods to solve simultaneous linear equations.

Course Outcomes: At the end of the Course, Student will be able to:

1. Determine rank, Eigenvalues and Eigen vectors of a given matrix and solve simultaneous linear equations.
2. Solve simultaneous linear equations numerically using various matrix methods.
3. Determine double integral over a region and triple integral over a volume.
4. Calculate gradient of a scalar function, divergence and curl of a vector function. Determine line, surface and volume integrals. Apply Green, Stokes and Gauss divergence theorems to calculate line, surface and volume integrals.

UNIT I: Linear systems of equations:

Rank-Echelon form-Normal form – Solution of linear systems – Gauss elimination - Gauss Jordan- Gauss Jacobi and Gauss Seidal methods.Applications: Finding the current in electrical circuits.

UNIT II: Eigen values - Eigen vectors and Quadratic forms:

Eigen values - Eigen vectors– Properties – Cayley-Hamilton theorem - Inverse and powers of a matrix by using Cayley-Hamilton theorem- Diagonalization- Quadratic forms-Reduction of quadratic form to canonical form – Rank - Positive, negative and semi definite

- Index – Signature.

Applications: Free vibration of a two-mass system.

UNIT III: Multiple integrals:

Curve tracing: Cartesian, Polar and Parametric forms.

Multiple integrals: Double and triple integrals – Change of variables – Change of order of integration.

Applications: Finding Areas and Volumes.

UNIT IV: Special functions:

Beta and Gamma functions- Properties - Relation between Beta and Gamma functions-Evaluation of improper integrals.

Applications: Evaluation of integrals.

UNIT V: Vector Differentiation:

Gradient- Divergence- Curl - Laplacian and second order operators -Vector identities.

Applications: Equation of continuity, potential surfaces

UNIT VI: Vector Integration:

Line integral – Work done – Potential function – Area- Surface and volume integrals
Greens, Stokes and Gauss Divergence theorems (without proof) and related problems.
Applications: Work done, Force.

Text Books:

1. **B.S.Grewal**, Higher Engineering Mathematics, 43rd Edition, Khanna Publishers.
2. **N.P.Bali**, Engineering Mathematics, Lakshmi Publications.

LINEAR SYSTEM OF EQUATIONSSUB-MATRIX OF A MATRIX

Suppose A is any matrix of the type $m \times n$, Then a matrix obtained by deleting some rows or columns or both from given matrix A is called a sub-matrix of A .

Eg: Let $A = \begin{bmatrix} 1 & 2 & 3 & 5 \\ 2 & -1 & 4 & 6 \\ 3 & 5 & 6 & 7 \end{bmatrix}_{3 \times 4}$

Then Submatrix of A is $\begin{bmatrix} 1 & 2 & 3 \\ 2 & -1 & 4 \end{bmatrix}$ (By deleting 3rd row and 4th column from A)

MINOR OF A MATRIX

Let A be $m \times n$ matrix. The determinant of a square sub-matrix of A is said to be the minor of the matrix.

Eg:- Let $A = \begin{bmatrix} 1 & 4 & 5 & 8 \\ 2 & -1 & 6 & 9 \\ 6 & 9 & 3 & 4 \end{bmatrix}$

This matrix has 3-rowed, 2-rowed and 1-rowed minors

$\begin{vmatrix} 1 & 4 & 5 \\ 2 & -1 & 6 \\ 6 & 9 & 3 \end{vmatrix}, \begin{vmatrix} 4 & 5 & 8 \\ -1 & 6 & 9 \\ 9 & 3 & 4 \end{vmatrix}$ etc are 3-rowed minors of A

$\begin{vmatrix} 1 & 4 \\ 2 & -1 \end{vmatrix}, \begin{vmatrix} 4 & 5 \\ -1 & 6 \end{vmatrix}, \begin{vmatrix} 5 & 8 \\ 6 & 9 \end{vmatrix}$ etc are 2-rowed minors of A

Each element of the matrix is called 1-rowed minor of A .

ELEMENTARY TRANSFORMATIONS (OR OPERATIONS)ON A MATRIX

There are three types of elementary transformations on a matrix

(i) Interchanging i th and j th rows, denoted by $R_i \leftrightarrow R_j$

www.FirstRanker.com

denoted by $R_i \rightarrow KR_i$

iii, Addition to any row say i th with K times the corresponding elements of j th row, denoted by $R_i \rightarrow R_i + KR_j$

$$C_i \rightarrow C_i + K C_j$$

ZERO ROW AND NON ZERO ROW

if all the elements in a row of a matrix are zeros, then it is called a zero row and if there is atleast one non-zero element in a row, then it is called a non-zero row.

Eg: $A = \begin{bmatrix} 1 & 2 & 3 & 4 \\ 0 & 0 & -2 & 1 \\ 0 & 0 & 0 & 9 \\ 0 & 0 & 0 & 0 \end{bmatrix}$ } $\rightarrow$ non-zero rows
 $\left. \begin{bmatrix} 0 & 0 & 0 & 0 \end{bmatrix} \right\} \rightarrow$ zero row.

EQUIVALENT MATRICES

Two matrices A and B are said to be Equivalent if any one of the matrix say B can be obtained by applying elementary operations on A . It is denoted by $A \sim B$.

RANK OF A MATRIX

A matrix is said to be of rank r if it has at least one non-zero $r \times r$ minor.

- A matrix is said to be of rank r if
- it has atleast one non-zero minor of order r and
 - Every minor of order higher than r is zero.
- ∴ The highest order of

Briefly, The rank of a matrix is the highest order of any non-zero minor of the matrix.

The rank of A is denoted by $P(A)$

- (i) Rank of a matrix is always unique.
- (ii) Every matrix will have rank.
- (iii) Rank of a null matrix is zero.
- (iv) Rank of the Identity matrix I_n is n .
- (v) if A is a matrix of order n and A is non-singular then $\rho(A) = n$.
- (vi) The rank of Singular matrix of order n is $< n$.
- (vii) if A is a matrix of order $m \times n$, then the rank of $A = \rho(A) \leq \min(m, n)$.
- (viii) $\rho(A) = \rho(A^T)$.

METHODS TO FIND THE RANK OF A MATRIX

Method 1: The rank can be determined by finding the highest order non-zero minor of matrix.

Method 2: Echelon form (Triangular form of a matrix)

Method 3: Normal form

Method 4: Normal form of the type PAQ

Method I:

Find the rank of the matrix $A = \begin{bmatrix} 1 & 2 & 3 \\ 3 & 4 & 5 \\ 4 & 5 & 6 \end{bmatrix}$

Soln: Minor of order 3 = $\begin{vmatrix} 1 & 2 & 3 \\ 3 & 4 & 5 \\ 4 & 5 & 6 \end{vmatrix} = 0$

The rank of the matrix cannot be 3 since third order minor is zero.

Minor of Second order $\begin{vmatrix} 1 & 2 \\ 3 & 4 \end{vmatrix} = -2 \neq 0$

The Second order minor is not Equal to Zero.

$\therefore$ The rank is 2

Soln:

Minor of the third order = 0

Minor of second order

$$\begin{vmatrix} 2 & 1 \\ 4 & 2 \end{vmatrix} = 0 \quad \begin{vmatrix} 1 & 3 \\ 2 & 6 \end{vmatrix} = 0 \quad \begin{vmatrix} 4 & 2 \\ 2 & 1 \end{vmatrix} = 0 \quad \begin{vmatrix} 2 & 6 \\ 1 & 3 \end{vmatrix} = 0$$

$$\begin{vmatrix} 2 & 3 \\ 4 & 6 \end{vmatrix} = 0 \quad \begin{vmatrix} 4 & 6 \\ 2 & 3 \end{vmatrix} = 0$$

All the possible minors of Second order are zero.

∴ The rank of the matrix is 1.

Method 2 : Echelon form

A matrix is said to be in Echelon form if it has the following three properties are satisfied

- zero rows, if any, must be below the non-zero rows.
- The first non-zero element of a non-zero is equal to 1.
- The number of zero rows before the first non-zero element of a row is less than such zero's in the next row.

NOTE: After reducing the matrix to Echelon form, the number of non-zero rows gives the rank of the matrix.

Reduce the matrix $A = \begin{bmatrix} 2 & 3 & 7 \\ 3 & -2 & 4 \\ 1 & -3 & -1 \end{bmatrix}$ into Echelon form and hence find its rank.

Soln:

Given matrix A is $A = \begin{bmatrix} 2 & 3 & 7 \\ 3 & -2 & 4 \\ 1 & -3 & -1 \end{bmatrix}$

$$\sim \begin{bmatrix} 1 & -3 & -1 \\ 3 & -2 & 4 \\ 2 & 3 & 7 \end{bmatrix}$$

$$R_2 \rightarrow R_2 - 3R_1; R_3 \rightarrow R_3 - 2R_1$$

$$\sim \begin{bmatrix} 1 & -3 & -1 \\ 0 & 7 & 7 \\ 0 & 9 & 9 \end{bmatrix}$$

$$R_2 \rightarrow \frac{R_2}{7} \sim \begin{bmatrix} 1 & -3 & -1 \\ 0 & 1 & 1 \\ 0 & 9 & 9 \end{bmatrix}$$

$$R_3: R_3 - 9R_2$$

$$\sim \begin{bmatrix} 1 & -3 & -1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

This is in Echelon form

$\therefore$ The number of non-zero rows is 2

Hence the rank of $A = 2$

Reduce to Echelon form and hence find the rank of the matrix

$$A = \begin{bmatrix} 1 & 2 & -4 & 5 \\ 2 & -1 & 3 & 6 \\ 8 & 1 & 9 & 7 \end{bmatrix}$$

Soln:

Given matrix is $A = \begin{bmatrix} 1 & 2 & -4 & 5 \\ 2 & -1 & 3 & 6 \\ 8 & 1 & 9 & 7 \end{bmatrix}$

$$R_2 \rightarrow R_2 - 2R_1, R_3 \rightarrow R_3 - 8R_1$$

$$\sim \begin{bmatrix} 1 & 2 & -4 & 5 \\ 0 & -5 & 11 & -4 \\ 0 & -15 & 41 & -33 \end{bmatrix}$$

$$R_3 \rightarrow R_3 - 3R_2$$

$$\sim \begin{bmatrix} 1 & 2 & -4 & 5 \\ 0 & -5 & 11 & -4 \\ 0 & 0 & 8 & -21 \end{bmatrix}$$

This is in Echelon form

Hence the number of non-zero rows = 3

$$P(A) = 3$$

Soln:

Given matrix is $A = \begin{bmatrix} 4 & 4 & -3 & 1 \\ 1 & 1 & -1 & 0 \\ K & 2 & 2 & 2 \\ 9 & 9 & K & 3 \end{bmatrix}$

$\begin{bmatrix} 4 & 4 & -3 & 1 \\ 1 & 1 & -1 & 0 \\ K & 2 & 2 & 2 \\ 9 & 9 & K & 3 \end{bmatrix}$ has rank 3

$R_1 \rightarrow R_2$

$\sim \begin{bmatrix} 1 & 1 & -1 & 0 \\ 4 & 4 & -3 & 1 \\ K & 2 & 2 & 2 \\ 9 & 9 & K & 3 \end{bmatrix}$

$R_2: R_2 \rightarrow 4R_1; R_3: R_3 \rightarrow KR_1; R_4: R_4 \rightarrow 9R_1$

$\sim \begin{bmatrix} 1 & 1 & -1 & 0 \\ 0 & 0 & 1 & 1 \\ 0 & 2-K & 2+K & 2 \\ 0 & 0 & K+9 & 3 \end{bmatrix}$

Since the given matrix is of rank 3. Then its 4th order minor is zero.

i.e. $|A| = 0$

$\begin{vmatrix} 1 & 1 & -1 & 0 \\ 0 & 0 & 1 & 1 \\ 0 & 2-K & 2+K & 2 \\ 0 & 0 & K+9 & 3 \end{vmatrix} = 0$

Expand along c_1 , $\begin{vmatrix} 0 & 1 & 1 \\ 2-K & 2+K & 2 \\ 0 & K+9 & 3 \end{vmatrix} = 0$

Again Expand along c_1 ,

$-(2-K) \begin{vmatrix} 1 & 1 \\ K+9 & 3 \end{vmatrix} = 0$

$\Rightarrow -(2-K)(3-K-9) = 0$

$\Rightarrow (-2+K)(-K-6) = 0$

$\Rightarrow K-2=0 \text{ or } -K-6=0$

$\Rightarrow K=2 \text{ or } -6$

Method 3 Normal form of a matrix

(Applying elementary row and column operations)

Every $m \times n$ matrix of rank r can be reduced by a finite number of elementary transformations to the form

$$\begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}$$

where I_r is the r -rowed unit matrix

The form $\begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}$ is called the normal form (or) canonical form.

The various normal forms are $\begin{bmatrix} I_2 & 0 \\ 0 & 0 \end{bmatrix}$, $\begin{bmatrix} I_3 & 0 \end{bmatrix}$, $\begin{bmatrix} I_4 \end{bmatrix}$ etc

Reduce the matrix $A = \begin{bmatrix} 1 & 2 & 1 & 0 \\ -2 & 4 & 3 & 0 \\ 1 & 0 & 2 & -8 \end{bmatrix}$ to canonical form and find its rank.

Soln: Given matrix is $A = \begin{bmatrix} 1 & 2 & 1 & 0 \\ -2 & 4 & 3 & 0 \\ 1 & 0 & 2 & -8 \end{bmatrix}$

$$R_2: R_2 + 2R_1; \quad R_3: R_3 - R_1$$

$$\sim \begin{bmatrix} 1 & 2 & 1 & 0 \\ 0 & 8 & 5 & 0 \\ 0 & -2 & 1 & -8 \end{bmatrix}$$

$$C_2: C_2 - 2C_1; \quad C_3: C_3 - C_1$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 8 & 5 & 0 \\ 0 & -2 & 1 & -8 \end{bmatrix}$$

$$R_2: \frac{R_2}{8}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & \frac{5}{8} & 0 \\ 0 & -2 & 1 & -8 \end{bmatrix}$$

$$R_3: R_3 + 2R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & \frac{5}{8} & 0 \\ 0 & 0 & 1 + \frac{5}{4} & -8 \end{bmatrix}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R_3 \rightarrow R_3 + R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R_3 \rightarrow R_3 + R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R_3 \rightarrow R_3 + R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\sim [I_3 \ 0]$$

This is the canonical form of the matrix A.

Hence the Rank of A = 3

Find the rank of the matrix $\begin{bmatrix} 2 & -2 & 0 & 6 \\ 4 & 2 & 0 & 2 \\ 1 & -1 & 0 & 3 \\ 1 & -2 & 1 & 2 \end{bmatrix}$ by reducing to canonical form.

Soln.:- Given matrix is $A = \begin{bmatrix} 2 & -2 & 0 & 6 \\ 4 & 2 & 0 & 2 \\ 1 & -1 & 0 & 3 \\ 1 & -2 & 1 & 2 \end{bmatrix}$

$$R_1 \leftrightarrow R_3$$

$$\sim \begin{bmatrix} 1 & -1 & 0 & 3 \\ 4 & 2 & 0 & 2 \\ 2 & -2 & 0 & 6 \\ 1 & -2 & 1 & 2 \end{bmatrix}$$

$$R_2: R_2 - 4R_1; R_3: R_3 - 2R_1; R_4: R_4 - R_1$$

$$\sim \begin{bmatrix} 1 & -1 & 0 & 3 \\ 0 & 6 & 0 & -10 \\ 0 & 0 & 0 & 0 \\ 0 & -1 & 1 & -1 \end{bmatrix}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 6 & 0 & -10 \\ 0 & 0 & 0 & 0 \\ 0 & -1 & 1 & -1 \end{bmatrix}$$

$$R_3 \leftrightarrow R_4$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 6 & 0 & -10 \\ 0 & -1 & 1 & -1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R_2 \leftrightarrow R_3$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 1 & -1 \\ 0 & 6 & 0 & -10 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R_2 \rightarrow (-1)R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & -1 & 1 \\ 0 & 6 & 0 & -10 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R_3: R_3 - 6R_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & -1 & 1 \\ 0 & 0 & 6 & -16 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$C_3: C_3 + C_2 \quad C_4: C_4 - C_2$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 6 & -16 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$R_3: \frac{R_3}{6}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & -\frac{16}{6} \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & -\frac{8}{3} \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$C_4: C_4 + \frac{8}{3}C_3$$

$$\sim \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\sim \begin{bmatrix} I_3 & 0 \\ 0 & 0 \end{bmatrix}$$

This is the normal form

$$\text{Rank of } A = 3$$

Every $m \times n$ matrix of rank r can be transformed to the form $PAQ = \begin{bmatrix} I_r & 0 \\ 0 & 0 \end{bmatrix}$ by elementary transformations where P and Q are non-singular matrices of orders m and n .

NOTE: If A be $m \times n$ matrix, then P and Q are square matrices of order m and n respectively.

Procedure:-

- (i) write $A = I_m A_{m \times n} I_n$
- (ii) Reduce the matrix A on L.H.S to normal form by applying elementary transformations
- (iii) Every elementary row transformation on A must be accompanied by the same transformation on the pre-factor of R.H.S
- (iv) Every elementary column transformation on A must be ~~also~~ accompanied by the same transformations on the post factor on R.H.S

Find the non-singular matrices P and Q such that PAQ is in the normal form of the matrix and find the rank of a matrix $A = \begin{bmatrix} 1 & 2 & 3 & -2 \\ 2 & -2 & 1 & 3 \\ 3 & 0 & 4 & 1 \end{bmatrix}$

Soln:

Given matrix is $A = \begin{bmatrix} 1 & 2 & 3 & -2 \\ 2 & -2 & 1 & 3 \\ 3 & 0 & 4 & 1 \end{bmatrix}_{3 \times 4}$

$$A = I_3 A I_4$$

$$\begin{bmatrix} 1 & 2 & 3 & -2 \\ 2 & -2 & 1 & 3 \\ 3 & 0 & 4 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 & 3 & -2 \\ 0 & -6 & -5 & 7 \\ 0 & -6 & -5 & 7 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ -3 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$C_2 \rightarrow C_2 - 2C_1, \quad C_3 \rightarrow C_3 - 3C_1, \quad C_4 : C_4 + 2C_1$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -6 & -5 & 7 \\ 0 & -6 & -5 & 7 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ -3 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & -2 & -3 & 2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$R_3 : R_3 - R_2$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & -6 & -5 & 7 \\ 0 & 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & 1 & -1 \end{bmatrix} A \begin{bmatrix} 1 & -2 & -3 & 2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$C_2 \rightarrow (-\frac{1}{6})C_2$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & -5 & 7 \\ 0 & 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & 1 & -1 \end{bmatrix} A \begin{bmatrix} 1 & \frac{1}{3} & -3 & 2 \\ 0 & -\frac{1}{6} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$C_3 : C_3 + 5C_2, \quad C_4 : C_4 - 7C_2$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & 1 & -1 \end{bmatrix} A \begin{bmatrix} 1 & \frac{1}{3} & -\frac{4}{3} & -\frac{1}{3} \\ 0 & -\frac{1}{6} & -\frac{5}{6} & \frac{7}{6} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} I_2 & 0 \\ 0 & 0 \end{bmatrix} = P A Q$$

$$\text{where } P = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & 1 & -1 \end{bmatrix} \text{ and } Q = \begin{bmatrix} 1 & \frac{1}{3} & -\frac{4}{3} & -\frac{1}{3} \\ 0 & -\frac{1}{6} & -\frac{5}{6} & \frac{7}{6} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

are non-singular matrices of A.

$$\therefore \text{Rank of } A = 2$$

$$[\because |P| \neq 0 \\ |Q| \neq 0]$$

Two non-singular matrices
 $\begin{bmatrix} 4 & 2 & 2 & -1 \\ 2 & 2 & 0 & 2 \end{bmatrix}$

P and Q such that PAQ is in normal form.

Soln: Given matrix is $A = \begin{bmatrix} 1 & -1 & -1 & 2 \\ 4 & 2 & 2 & -1 \\ 2 & 2 & 0 & -2 \end{bmatrix}_{3 \times 4}$

$$A = I_3 A I_4$$

$$\begin{bmatrix} 1 & -1 & -1 & 2 \\ 4 & 2 & 2 & -1 \\ 2 & 2 & 0 & -2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$R_2: R_2 - 4R_1, \quad R_3: R_3 - 2R_1$$

$$\begin{bmatrix} 1 & -1 & -1 & 2 \\ 0 & 6 & 6 & -9 \\ 0 & 4 & 2 & -6 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -4 & 1 & 0 \\ -2 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$C_2: C_2 + C_1; \quad C_3: C_3 + C_1; \quad C_4: C_4 - 2C_1$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 6 & 6 & -9 \\ 0 & 4 & 2 & -6 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -4 & 1 & 0 \\ -2 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 1 & 1 & -2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$R_2: \frac{R_2}{6}$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 1 & -\frac{3}{2} \\ 0 & 4 & 2 & -6 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -\frac{4}{6} & \frac{1}{6} & 0 \\ -2 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 1 & 1 & -2 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$R_3: R_3 - 4R_2$$

$$[\because |P| \neq 0 \quad |Q| \neq 0]$$

$\therefore$ The rank of $A = 3$.

THE INVERSE OF A NON-SINGULAR MATRIX BY ELEMENTARY TRANSFORMATIONS

(GAUSS-JORDAN METHOD)

Suppose A is a non-singular matrix of order n .

Then we write $A = I_n A$ ——— ①

We reduce the matrix A on the L.H.S to be Identity matrix I_n by applying elementary row transformations only. Each elementary row transformation will be applied to the prefactor I_n of the R.H.S of Equation ①

i.e. ① becomes $I_n = BA$

The B is the inverse of A

$$B = A^{-1}$$

Find the Inverse of matrix $\begin{bmatrix} 2 & -1 & 3 \\ 1 & 1 & 1 \\ 1 & -1 & 1 \end{bmatrix}$ using elementary operations.

Soln:

$$\text{Let } A = \begin{bmatrix} 2 & -1 & 3 \\ 1 & 1 & 1 \\ 1 & -1 & 1 \end{bmatrix}_{3 \times 3}$$

$$A = I_n A$$

$$\begin{bmatrix} 2 & -1 & 3 \\ 1 & 1 & 1 \\ 1 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$R_1 \leftrightarrow R_2$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 2 & -1 & 3 \\ 1 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} A$$

$$R_2 = R_2 - 2R_1 ; R_3 = R_3 - R_1$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & -3 & 1 \\ 0 & -2 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ 1 & -2 & 0 \\ 0 & -1 & 1 \end{bmatrix} A$$

$$I_4 = B A$$

$$\text{where } B = \bar{A}^{-1} = \begin{bmatrix} -3 & 3 & -3 & 2 \\ 3 & -4 & 4 & -2 \\ -3 & 4 & -5 & 3 \\ 2 & -2 & 3 & -2 \end{bmatrix}$$

Consider the System of m Linear Equations in n unknowns

$x_1, x_2, \dots, x_n$ as given below

$$\left. \begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \dots &\dots \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n &= b_m \end{aligned} \right\} \text{--- (1)}$$

where all the a 's and b 's are constant.

Matrix form is

$$\begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{bmatrix} \text{--- (2)}$$

$A \quad X = B$

Where $A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$ is called the coefficient matrix

$X = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$ is the matrix of unknown.

$B = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{bmatrix}$ is the column matrix of constants.

if $B=0$, the system (2) is said to be homogeneous.

if atleast one of $b_1, b_2, \dots, b_n$ is not zero, the system (2) is said to be non-homogeneous.

Consistent
A System of Equations (1) is said to be consistent if the system has a solution.
if the given system is consistent, it can have either unique solution (or) infinitely many solutions.

Inconsistent
A system of Equations (1) is said to be inconsistent if the system has no solution.

Augmented Matrix

A matrix which is obtained by adding the column matrix B as the last column in the coefficient matrix A is called augmented matrix and is denoted by $[AB]$

$$[AB] = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} & b_1 \\ a_{21} & a_{22} & \dots & a_{2n} & b_2 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} & b_m \end{bmatrix}$$

SOLUTION OF SYSTEM OF LINEAR EQUATIONS

Method : 1 : RANK METHOD

1. Non-Homogeneous linear Equations

Consider m linear non-homogeneous in " n " unknowns as given below

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$

$$\vdots$$

$$a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = b_m$$

Matrix form is $A X = B$

$$\begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{bmatrix}$$

1. Condition of consistency

The system of Equation $AX=B$ is consistent if and only if $\text{rank } A = \text{rank } [AB]$

2. Nature of Solution

The system of Equations $AX=B$ is said to be

(i) consistent if $P(A) = P(AB)$

(ii) consistent and an unique solution

if $P(A) = P(AB) = r = n$

where r is the rank and n is the number of unknowns.

(iii) consistent and an infinite number of solutions if $P(A) = P(AB) = r < n$

In this case, we have to give arbitrary values to $n-r$ variables and the remaining variables expressed in terms of these arbitrary values.

(iv) Inconsistent if $P(A) \neq P(AB)$

3. Method of finding the rank A and rank $[AB]$

Reduce the augmented matrix $[AB]$ to Echelon form by elementary row transformations. Then the matrix A will be reduced to the Echelon form.

Solve them

$x+y+2z=4$; $2x-y+3z=9$; $3x-y-z=2$

Soln:

Given system of Equations can be written in matrix form

$$\begin{bmatrix} 1 & 1 & 2 \\ 2 & -1 & 3 \\ 3 & -1 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 9 \\ 2 \end{bmatrix}$$

$$A \quad X = B$$

Augmented matrix is $[AB] = \begin{bmatrix} 1 & 1 & 2 & 4 \\ 2 & -1 & 3 & 9 \\ 3 & -1 & -1 & 2 \end{bmatrix}$

$$R_2: R_2 - 2R_1; \quad R_3: R_3 - 3R_1$$

$$\begin{bmatrix} 1 & 1 & 2 & 4 \\ 0 & -3 & -1 & 1 \\ 0 & -4 & -7 & -10 \end{bmatrix}$$

$$R_2: \frac{R_2}{-3}$$

$$\begin{bmatrix} 1 & 1 & 2 & 4 \\ 0 & 1 & \frac{1}{3} & -\frac{1}{3} \\ 0 & -4 & -7 & -10 \end{bmatrix}$$

$$R_3: R_3 + 4R_2$$

$$\begin{bmatrix} 1 & 1 & 2 & 4 \\ 0 & 1 & \frac{1}{3} & -\frac{1}{3} \\ 0 & 0 & -7 + \frac{4}{3} & -10 + 4(-\frac{1}{3}) \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 2 & 4 \\ 0 & 1 & \frac{1}{3} & -\frac{1}{3} \\ 0 & 0 & -\frac{17}{3} & -\frac{34}{3} \end{bmatrix}$$

$$R_3: \left(\frac{-3}{17}\right) R_3$$

$$\begin{bmatrix} 1 & 1 & 2 & 4 \\ 0 & 1 & \frac{1}{3} & -\frac{1}{3} \\ 0 & 0 & 1 & 2 \end{bmatrix}$$

This is in Echelon form

$$\text{rank of } A = 3$$

$$\text{rank of } AB = 3$$

$$\text{number of unknowns } (n) = 3$$

The given system is consistent and it has a unique solution.

$$x + y + 2z = 4 \quad \text{--- (1)}$$

$$y + \frac{1}{3}z = -\frac{1}{3} \quad \text{--- (2)}$$

$$z = 2 \quad \text{--- (3)}$$

$$y + \frac{1}{3}(2) = -\frac{1}{3}$$

$$\Rightarrow y = -\frac{1}{3} - \frac{2}{3} = \frac{-1-2}{3} = -\frac{3}{3}$$

$$\Rightarrow \boxed{y = -1}$$

$$x - 1 + 4 = 4$$

$$\Rightarrow x + 3 = 4$$

$$\Rightarrow x = 4 - 3 = 1$$

$$\therefore \boxed{x = 1}$$

$\therefore x=1; y=-1; z=2$ is the unique solution of given system of Equations.

Test for consistency and solve

$$5x + 3y + 7z = 4$$

$$3x + 26y + 2z = 9$$

$$7x + 2y + 10z = 5$$

Soln:

Given system of Equations can be written in the matrix form

$$\begin{bmatrix} 5 & 3 & 7 \\ 3 & 26 & 2 \\ 7 & 2 & 10 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 9 \\ 5 \end{bmatrix}$$

$$X = B$$

Augmented matrix is $[AB] = \begin{bmatrix} 5 & 3 & 7 & 4 \\ 3 & 26 & 2 & 9 \\ 7 & 2 & 10 & 5 \end{bmatrix}$

$$R_1: \frac{R_1}{5}$$

R₂ : R₂ - 3R₁

$$\begin{bmatrix} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 3-3 & 26-\frac{9}{5} & 2-\frac{21}{5} & 9-\frac{12}{5} \\ 7 & 2 & 10 & 5 \end{bmatrix}$$

www.FirstRanker.com

$$\begin{bmatrix} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & \frac{121}{5} & -\frac{11}{5} & \frac{33}{5} \\ 7 & 2 & 10 & 5 \end{bmatrix}$$

R₃ : R₃ - 7R₁

$$\begin{bmatrix} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & \frac{121}{5} & -\frac{11}{5} & \frac{33}{5} \\ 7-7 & 2-\frac{21}{5} & 10-\frac{49}{5} & 5-\frac{28}{5} \end{bmatrix}$$

$$\begin{bmatrix} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & \frac{121}{5} & -\frac{11}{5} & \frac{33}{5} \\ 0 & -\frac{11}{5} & \frac{1}{5} & -\frac{3}{5} \end{bmatrix}$$

R₂ : $\left(\frac{5}{121}\right) R_2$

$$\begin{bmatrix} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & 1 & -\frac{1}{11} & \frac{3}{11} \\ 0 & -\frac{11}{5} & \frac{1}{5} & -\frac{3}{5} \end{bmatrix}$$

R₃ : R₃ + $\frac{11}{5}(R_2)$

$$\begin{bmatrix} 1 & \frac{3}{5} & \frac{7}{5} & \frac{4}{5} \\ 0 & 1 & -\frac{1}{11} & \frac{3}{11} \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

rank of A = 2

rank of [A] = 2

number of unknowns (n) = 3

$$P(A) = P(B) = 2 < 3 = n$$

The given system is consistent and it has an infinite number of solutions.

$$x + \frac{3}{5}y + \frac{7}{5}z = \frac{4}{5} \quad \text{--- (1)}$$

$$y - \frac{1}{11}z = \frac{3}{11} \quad \text{--- (2)}$$

put $z = k$

$$y - \frac{1}{11}k = \frac{3}{11}$$

$$\Rightarrow y = \frac{3}{11} + \frac{k}{11}$$

$$\Rightarrow y = \frac{3+k}{11}$$

~~$$55x + 9 + 3k + 7k = \frac{4}{5}$$~~

$$x + \frac{3}{5}\left(\frac{3+k}{11}\right) + \frac{7}{5}(k) = \frac{4}{5}$$

$$\Rightarrow \frac{55x + 9 + 3k + 77k}{55} = \frac{4}{5}$$

$$\Rightarrow 55x + 9 + 80k = \frac{4}{5}(55)$$

$$\Rightarrow 55x = 44 - 9 + 80k$$

$$\Rightarrow x = \frac{35 - 80k}{55} = \frac{7 - 16k}{11}$$

$$\Rightarrow x = \frac{7 - 16k}{11}$$

$\therefore x = \frac{7-16k}{11}$, $y = \frac{3+k}{11}$, $z = k$ is the unique solution of given Equation.

Discuss for what values of λ, μ the Simultaneous Equations $x+y+z=6$, $x+2y+3z=10$; $x+2y+\lambda z=\mu$ have (i) no solution (ii) a unique solution (iii) An infinite number of solutions.

Soln: Given system of Equations can be written in the Matrix form

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 2 & \lambda \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 6 \\ 10 \\ \mu \end{bmatrix}$$

$$A \quad X \quad = \quad B$$

The augmented matrix is $[AB] = \begin{bmatrix} 1 & 1 & 1 & 6 \\ 1 & 2 & 3 & 10 \\ 1 & 2 & \lambda & \mu \end{bmatrix}$

$$\begin{bmatrix} 1 & 1 & 1 & 6 \\ 0 & 1 & 2 & 4 \\ 0 & 1 & \lambda-1 & \mu-6 \end{bmatrix}$$

$$R_3 : R_3 - R_2$$

$$\begin{bmatrix} 1 & 1 & 1 & 6 \\ 0 & 1 & 2 & 4 \\ 0 & 0 & \lambda-3 & \mu-10 \end{bmatrix}$$

- i) The given system has no solution if $\lambda=3$ and $\mu \neq 10$
then $P(A) = 2$ and $P(AB) = 3$
 $\therefore$ For $\lambda=3$ and $\mu \neq 10$; the system has no solution
- ii) The given system has a unique solution
if $\lambda \neq 3$ and for any value of μ . then
 $P(A) = P(AB) = 3$
- iii) The given system has infinite number of
solutions if $\lambda=3$ and $\mu=10$ then $P(A) = P(AB)$
 $= 2 < 3$

II. Homogeneous linear Equations:

consider 'm' homogeneous linear Equations in
'n' unknowns as given below

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= 0 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= 0 \\ \dots &\dots \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n &= 0 \end{aligned}$$

The given system of Equations can be written in the
matrix form

$$\begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix}$$

$A \quad X = 0$

Consistency: Here the coefficient matrix A and the augmented matrix $[AB]$ are same. then the system of Equations is always consistent.

Method of finding the rank of A Reduce the coefficient matrix A to Echelon form and determine the rank of A .

Let r be the rank of the coefficient matrix and n be the number of unknowns.

Trivial Solution: The solution $x_1 = x_2 = \dots = x_n = 0$ is said to be trivial solution (zero solution) of the system of homogeneous Equation $AX = 0$

Solution procedure:

- (i) if $\rho(A) = r = n$ then the given system of Equations $AX = 0$ possesses only a trivial (zero solution)
 - ie $x_1 = x_2 = x_3 = \dots = x_n = 0$
- (ii) if $\rho(A) = r < n$ then the given system of Equations possesses an infinite number of solutions.

NOTE:

- (1) if A is a non-singular matrix, then the linear system $AX = 0$ has only a zero solution.
- (2) if A is a singular then the linear system $AX = 0$ has a non-zero solution.
 - ie we get an infinite number of solutions.

Solve and solve $x+y=0$, $y+z=0$, $z+x=0$
Soln: Given system of Equations can be written in the matrix form

$$\begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$A X = 0$$

coefficient matrix $A = \begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix}$

$$R_3: R_3 - R_1$$

$$\begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 0 & -1 & 1 \end{bmatrix}$$

$$R_3: R_3 + R_2$$

$$\begin{bmatrix} 1 & 1 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 2 \end{bmatrix}$$

$$\text{rank of } A = 3$$

$$\text{number of unknowns, } m = 3$$

$$\text{rank of } A = \text{number of unknowns}$$

The given system of Equations has a trivial solution.

$$\text{i.e. } x = y = z = 0$$

Solve completely the system of Equations $x+3y-2z=0$,

$$2x-y+4z=0; \quad x-11y+14z=0$$

Soln: Given system of Equations can be written in the matrix form

$$\begin{bmatrix} 1 & 3 & -2 \\ 2 & -1 & 4 \\ 1 & -11 & 14 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$A X = 0$$

$$R_2: R_2 - 2R_1$$

$$\begin{bmatrix} 1 & 3 & -2 \\ 0 & -7 & 8 \\ 1 & -11 & 14 \end{bmatrix}$$

$$R_3: R_3 - R_1$$

$$\begin{bmatrix} 1 & 3 & -2 \\ 0 & -7 & 8 \\ 0 & -14 & 16 \end{bmatrix}$$

$$R_2: R_2 \times \frac{-1}{7}$$

$$\begin{bmatrix} 1 & 3 & -2 \\ 0 & 1 & -\frac{8}{7} \\ 0 & -14 & 16 \end{bmatrix}$$

$$R_3: R_3 + 14R_2$$

$$\begin{bmatrix} 1 & 3 & -2 \\ 0 & 1 & -\frac{8}{7} \\ 0 & 0 & 0 \end{bmatrix}$$

$$\text{rank of } A = 2$$

$$\text{number of unknowns } (n) = 3$$

$$r = 2 < 3 = n$$

The given system of Equations has an infinite number solutions.

$$n - r = 3 - 2 = 1$$

$$x + 3y - 2z = 0 \quad \text{--- (1)}$$

$$y - \frac{8}{7}z = 0 \quad \text{--- (2)}$$

$$\text{let } z = k$$

$$y - \frac{8}{7}k = 0 \Rightarrow y = \frac{8}{7}k$$

$$x + \frac{24}{7}k - 2k = 0$$

$$\Rightarrow x = 2k - \frac{24k}{7} = -\frac{10k}{7}$$

$\therefore x = -\frac{10k}{7}$; $y = \frac{8}{7}k$; $z = k$ is the general solution of the given system.

$$2x_1 - 2x_2 + x_3 = \lambda x_1$$

$$2x_1 - 3x_2 + 2x_3 = \lambda x_2$$

$$-x_1 + 2x_2 = \lambda x_3$$

can possess a non-trivial solution only if $\lambda = 1$; $\lambda = -3$ and obtain the general solution in each case.

Soln:- Given system of Equations can be written in the matrix form

$$\begin{bmatrix} 2-\lambda & -2 & 1 \\ 2 & -3-\lambda & 2 \\ -1 & 2 & -\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

if the given system possesses a non-trivial solution then Δ is singular.

$$\text{i.e. } \begin{vmatrix} 2-\lambda & -2 & 1 \\ 2 & -3-\lambda & 2 \\ -1 & 2 & -\lambda \end{vmatrix} = 0$$

$$\Rightarrow (2-\lambda) [(3+\lambda)(\lambda) - 4] + 2[-2\lambda + 2] + 1[4 - 3 - \lambda] = 0$$

$$\Rightarrow (2-\lambda) [\lambda^2 + 3\lambda - 4] - 4(\lambda - 1) + 1(\lambda - 1) = 0$$

$$\Rightarrow (2-\lambda) (\lambda - 1)(\lambda + 4) - 4(\lambda - 1) - 1(\lambda - 1) = 0$$

$$\Rightarrow (\lambda - 1) [(2-\lambda)(\lambda + 4) - 4 - 1] = 0$$

$$\Rightarrow (\lambda - 1) [-\lambda^2 - 2\lambda + 8 - 5] = 0$$

$$\Rightarrow (\lambda - 1) [-\lambda^2 - 2\lambda + 3] = 0$$

$$\Rightarrow (\lambda - 1) [\lambda^2 + 2\lambda - 3] = 0$$

$$\Rightarrow (\lambda - 1) (\lambda - 1) (\lambda + 3) = 0$$

$$\Rightarrow \lambda = 1, 1, -3$$

The given system has non-trivial solution for $\lambda = 1$ and $\lambda = -3$.

Case (i) $\lambda = 1$

$$A = \begin{bmatrix} 1 & -2 & 1 \\ 2 & -4 & 2 \\ -1 & 2 & -1 \end{bmatrix}$$

$$R_2: R_2 - 2R_1 \quad ; \quad R_3: R_3 + R_1$$

$$\begin{bmatrix} 1 & -2 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\text{rank of } A = 1$$

$$n = 3$$

$$n - r = 3 - 1 = 2$$

$$x - 2y + z = 0 \quad \text{--- (1)}$$

$$\text{Let } z = k_1 \quad \text{--- (2)}$$

$$y = k_2 \quad \text{--- (3)}$$

$$x - 2k_2 + k_1 = 0$$

$$\Rightarrow x = -k_1 + 2k_2$$

$\therefore x = 2k_2 - k_1$; $y = k_2$; $z = k_1$ is the general solution of the given system of equations if $\lambda = 1$

Case (ii) $\lambda = 3$

$$A = \begin{bmatrix} 5 & -2 & 1 \\ 2 & 0 & 2 \\ -1 & 2 & 3 \end{bmatrix}$$

$$R_1 \leftrightarrow R_2 \quad \begin{bmatrix} -1 & 2 & 3 \\ 2 & 0 & 2 \\ 5 & -2 & 1 \end{bmatrix}$$

$$R_2: R_2 + 2R_1 \quad ; \quad R_3: R_3 + 5R_1$$

$$\sim \begin{bmatrix} -1 & 2 & 3 \\ 0 & 4 & 8 \\ 0 & 8 & 16 \end{bmatrix}$$

$$\sim \begin{bmatrix} -1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 8 & 16 \end{bmatrix}$$

$$R_3: R_3 - 8R_2$$

$$\sim \begin{bmatrix} -1 & 2 & 3 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\text{rank of } A = r = 2$$

$$n = 3$$

$$n - r = 3 - 2 = 1$$

$$-x + 2y + 3z = 0 \quad \text{--- (1)}$$

$$y + 2z = 0 \quad \text{--- (2)}$$

$$z = k \quad \text{--- (3)}$$

$$y + 2k = 0$$

$$\Rightarrow \boxed{y = -2k}$$

$$-x - 4k + 3k = 0$$

$$\Rightarrow -x - k = 0$$

$$\Rightarrow \boxed{x = -k}$$

$\therefore x = -k; y = -2k; z = k$ is the general solution of the given system of Equations.

$$\text{if } \lambda = -3$$

Consider the System of Equations be

$$a_{11}x_1 + a_{12}x_2 + a_{13}x_3 = b_1$$

$$a_{21}x_1 + a_{22}x_2 + a_{23}x_3 = b_2$$

$$a_{31}x_1 + a_{32}x_2 + a_{33}x_3 = b_3$$

Matrix form is

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

$$A X = B$$

The augmented matrix is $[AB] = \begin{bmatrix} a_{11} & a_{12} & a_{13} & b_1 \\ a_{21} & a_{22} & a_{23} & b_2 \\ a_{31} & a_{32} & a_{33} & b_3 \end{bmatrix}$

Reduce the augmented matrix $[AB]$ to Echelon form by applying E-row operations only.

Let the Equivalent matrix is $[AB] = \begin{bmatrix} a_{11} & a_{12} & a_{13} & b_1 \\ 0 & a'_{22} & a'_{23} & b'_2 \\ 0 & 0 & a''_{33} & b''_3 \end{bmatrix}$

Its Equivalent matrix Equation is given by

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ 0 & a'_{22} & a'_{23} \\ 0 & 0 & a''_{33} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b'_2 \\ b''_3 \end{bmatrix}$$

By solving this, we obtained the values of x_1, x_2, x_3 by back substitution.

by Gauss-Elimination method.

Soln: The given system of Equations can be written in the matrix form

$$\begin{bmatrix} 3 & 1 & 2 \\ 2 & -3 & -1 \\ 1 & 2 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 3 \\ -3 \\ 4 \end{bmatrix}$$

$A \quad x = B$

Augmented matrix is $[AB] = \begin{bmatrix} 3 & 1 & 2 & 3 \\ 2 & -3 & -1 & -3 \\ 1 & 2 & 1 & 4 \end{bmatrix}$

$R_1 \leftrightarrow R_3$

$$\begin{bmatrix} 1 & 2 & 1 & 4 \\ 2 & -3 & -1 & -3 \\ 3 & 1 & 2 & 3 \end{bmatrix}$$

$R_2 - 2R_1 ; R_3 - 3R_1$

$$\sim \begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & -7 & -3 & -11 \\ 0 & -5 & -1 & -9 \end{bmatrix}$$

$R_2 : \frac{R_2}{-7}$

$$\sim \begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & \frac{3}{7} & \frac{11}{7} \\ 0 & -5 & -1 & -9 \end{bmatrix}$$

$R_3 : R_3 + 5R_2$

$$\begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & \frac{3}{7} & \frac{11}{7} \\ 0 & 0 & \frac{8}{7} & -\frac{8}{7} \end{bmatrix}$$

$R_3 : (\frac{7}{8})R_3$

$$\begin{bmatrix} 1 & 2 & 1 & 4 \\ 0 & 1 & \frac{3}{7} & \frac{11}{7} \\ 0 & 0 & 1 & -1 \end{bmatrix}$$

This is in Echelon form

$x + 2y + z = 4$ — (1)

$y + \frac{3}{7}z = \frac{11}{7}$ — (2)

$z = -1$ — (3)

$$y + \frac{3}{7}(-1) = \frac{11}{7}$$

$$y = \frac{11}{7} + \frac{3}{7} = \frac{14}{7} = 2$$

$$y = 2, z = -1 \quad \text{Substitute in (1)} \quad \boxed{y=2}$$

$$x + 2(2) - 1 = 4$$

$$x + 3 = 4$$

$$x = 4 - 3 = 1$$

$$\boxed{x=1}$$

$\therefore$ The solution is $x=1; y=2; z=-1$

METHOD: 3

GAUSS - JORDAN METHOD

Consider given system of linear Equations in matrix form $AX=B$. Reduce the augmented matrix $[AB]$ by applying E-row operations only such that the coefficient matrix A is in diagonal form $[D:B]$. The solution can be obtained directly without any backward substitution.

Solve the system of Equations $x+y+z=8$, $2x+3y+2z=19$

$4x+2y+3z=23$ using Gauss-Jordan method.

Soln:

The given system of Equations can be written in the matrix form

$$\begin{bmatrix} 1 & 1 & 1 \\ 2 & 3 & 2 \\ 4 & 2 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 8 \\ 19 \\ 23 \end{bmatrix}$$

$$A \quad X \quad = \quad B$$

The augmented matrix is $[AB] = \begin{bmatrix} 1 & 1 & 1 & 8 \\ 2 & 3 & 2 & 19 \\ 4 & 2 & 3 & 23 \end{bmatrix}$

$$R_3: R_3 + 2R_2$$

$$R_1: R_1 - R_2$$

$$R_3: 6R_3$$

$$R_1: R_1 - R_3$$

$$x=2, y=3, z=3$$

∴ The solution is $x=2, y=3, z=3$.

METHOD II GAUSS-SEIDEL ITERATION METHOD

Gauss-Seidel method is an iterative method of solving a system of equations. This method is also called "method of successive correction" or Gauss-Jacobi method.

Consider the system of equations

$$\left. \begin{aligned} a_{11}x + a_{12}y + a_{13}z &= b_1 \\ a_{21}x + a_{22}y + a_{23}z &= b_2 \\ a_{31}x + a_{32}y + a_{33}z &= b_3 \end{aligned} \right\} \quad \text{--- (1)}$$

Condition for applying Gauss-Seidel method is that diagonal coefficients are not zero and they are absolute value compared to other coefficients.

The coefficient matrix should be diagonally dominant. Such system is called a "diagonally dominant system". If not interchange the Equations to make it diagonally dominant.

The system of Equations (1) can be written as

$$x = \frac{1}{a_{11}} [b_1 - a_{12}y - a_{13}z] \quad \text{--- (2)}$$

$$y = \frac{1}{a_{22}} [b_2 - a_{21}x - a_{23}z] \quad \text{--- (3)}$$

$$z = \frac{1}{a_{33}} [b_3 - a_{31}x - a_{32}y] \quad \text{--- (4)}$$

Step: 1 As a first approximation, initially we take $y=0$ and $z=0$ in (2) we get $x = \frac{1}{a_{11}} (b_1)$

Then in Equation (3), put $x = \frac{b_1}{a_{11}}$ and $z=0$ then find the value of y .

$$y = \frac{1}{a_{22}} \left[b_2 - \frac{a_{21}b_1}{a_{11}} \right]$$

Then in Equation (4), we put these values of x and y to obtain the value of z .

$$z = \frac{1}{a_{33}} \left[b_3 - a_{31} \left(\frac{b_1}{a_{11}} \right) - \frac{a_{32}}{a_{22}} \left[b_2 - \frac{a_{21}b_1}{a_{11}} \right] \right]$$

Step: 2 we repeated the above procedure, in the Equation (2) we put the values of y and z obtained in Step (1) and redetermine x . By using the new value redetermine y and so on.

This method uses the latest values of unknowns in each step.

The process is stopped, when two successive solutions are equal (or) nearly same.

$$10x + y + z = 12 ; 2x + 10y + z = 13 ; 2x + 2y + 10z = 14$$

Soln: The numbers 10, 10, 10 are in the leading diagonals are the largest in the respective Equations. The given system is diagonally dominant.

We apply Gauss-Seidel method to solve the above system of Equations. The given Equations can be written as

$$x = \frac{1}{10} [12 - y - z] \quad \text{--- (1)}$$

$$y = \frac{1}{10} [13 - 2x - z] \quad \text{--- (2)}$$

$$z = \frac{1}{10} [14 - 2x - 2y] \quad \text{--- (3)}$$

1st approximation put $y = z = 0$ in (1)

$$\text{Then } x = \frac{12}{10} = 1.2 \quad \boxed{x = 1.2}$$

again putting $x = 1.2$ & $z = 0$ in (2)

$$\begin{aligned} \text{we get } y &= \frac{1}{10} [13 - 2(1.2)] \\ &= \frac{13 - 2.4}{10} = \frac{10.6}{10} = 1.06 \end{aligned}$$

$$\therefore \boxed{y = 1.06}$$

put $y = 1.06$; $x = 1.2$ in Eqn (3)

$$\begin{aligned} \text{we get } z &= \frac{1}{10} [14 - 2(1.2) - 2(1.06)] \\ &= \frac{14 - 2.4 - 2.12}{10} = 0.95 \end{aligned}$$

$$\therefore \boxed{z = 0.95}$$

2nd approximation:

put $y = 1.06$ and $z = 0.95$ in (1)

$$x = \frac{1}{10} [12 - 1.06 - 0.95] = 0.999$$

$$y = \frac{1}{10} [13 - 1.998 - 0.95] = 1.005$$

$$z = \frac{1}{10} [14 - 1.998 - 2.010] = 0.999$$

$$x = \frac{1}{10} [12 - 1.005 - 0.999] = 1.00$$

$$y = \frac{1}{10} [13 - 2.0 - 0.999] = 1.0001 = 1.00$$

$$z = \frac{1}{14} [14 - 2.0 - 2.0] = 1.00$$

4th approximation:

$$x = \frac{1}{10} [12 - 1 - 1] = 1.00$$

$$y = \frac{1}{10} [13 - 2 - 1] = 1.00$$

$$z = \frac{1}{10} [14 - 2 - 2] = 1.00$$

Since the value of 3rd and 4th iterations are

Similar, we get the solution as $x=1$; $y=1$; $z=1$

Solve using Gauss-Seidal Iteration method

$$x_1 + 10x_2 + x_3 = 6$$

$$10x_1 + x_2 + x_3 = 6$$

$$x_1 + x_2 + 10x_3 = 6$$

Soln:- The coefficient matrix is not diagonally dominant.
if we interchange the first and second Equations,
we get a diagonally dominant system.

$$10x_1 + x_2 + x_3 = 6$$

$$x_1 + 10x_2 + x_3 = 6$$

$$x_1 + x_2 + 10x_3 = 6$$

The above Equation can be written as

$$x_1 = \frac{1}{10} [6 - x_2 - x_3] \text{ --- (1)}$$

$$x_2 = \frac{1}{10} [6 - x_3 - x_1] \text{ --- (2)}$$

$$x_3 = \frac{1}{10} [6 - x_1 - x_2] \text{ --- (3)}$$

1st approximation

$$\text{put } x_2 = x_3 = 0 \text{ in (1)}$$

$$x_1 = \frac{1}{10} (6) = 0.6$$

putting $x_1 = 0.6$ and $x_3 = 0$ in Eqn (2)

$$x_2 = \frac{1}{10} [6 - 0 - 0.6] = \frac{5.4}{10} = 0.54$$

$$x_3 = \frac{1}{10} [6 - 0.6 - 0.54] = \frac{4.86}{10} = 0.486$$

2nd approximation : Again start from Eqn (1) putting $x_2 = 0.54$ and $x_3 = 0.486$ as obtained in iteration 1.

$$x_1 = \frac{1}{10} [6 - 0.54 - 0.486] = 0.4974$$

proceeding like this, we get tabular form

Iterations	x_1	x_2	x_3
1	0.6	0.54	0.486
2	0.4974	0.5017	0.4992
3	0.4999	0.5	0.5

Thus the solution is $x_1 = 0.5$; $x_2 = 0.5$; $x_3 = 0.5$

APPLICATIONS TO MATRIX ANALYSIS

Finding the current in Electrical circuits

Find the current in each cell considering the circuit given below

Soln:

According to Kirchhoff's Voltage law in the loop ABEFA

$$40i_1 + 10(i_1 + i_2) = 6$$

$$\Rightarrow 40i_1 + 10i_1 + 10i_2 = 6$$

$$\Rightarrow 50i_1 + 10i_2 = 6 \quad \text{--- (1)}$$

$$10(i_1 + i_2) + 50i_2 = 2$$

$$\Rightarrow 10i_1 + 10i_2 + 50i_2 = 2$$

$$\Rightarrow 10i_1 + 60i_2 = 2 \quad \text{--- (2)}$$

From (1) & (2)

Matrix form is

$$\begin{bmatrix} 50 & 10 \\ 10 & 60 \end{bmatrix} \begin{bmatrix} i_1 \\ i_2 \end{bmatrix} = \begin{bmatrix} 6 \\ 2 \end{bmatrix}$$

$$A X = B$$

Augmented matrix is $[AB] = \begin{bmatrix} 50 & 10 & 6 \\ 10 & 60 & 2 \end{bmatrix}$

$$R_1 \rightarrow \frac{R_1}{50}$$

$$\begin{bmatrix} 1 & \frac{1}{5} & \frac{3}{25} \\ 10 & 60 & 2 \end{bmatrix}$$

$$R_2 \rightarrow R_2 - 10R_1$$

$$\begin{bmatrix} 1 & \frac{1}{5} & \frac{3}{25} \\ 0 & 58 & \frac{4}{5} \end{bmatrix}$$

$$R_2 \rightarrow \frac{R_2}{58}$$

$$\begin{bmatrix} 1 & \frac{1}{5} & \frac{3}{25} \\ 0 & 1 & \frac{2}{145} \end{bmatrix}$$

$$i_2 = \frac{2}{145} = 0.01379 \text{ Amp}$$

~~equation~~

$$i_1 + \frac{1}{5}i_2 = \frac{3}{25}$$

$$\Rightarrow i_1 + \frac{1}{5}(0.01379) = \frac{3}{25}$$

$$\Rightarrow i_1 + 0.002758 = 0.12$$

$$\Rightarrow i_1 = 0.12 - 0.002758$$

$$i_1 = 0.1172 \text{ Amp}$$

$$\therefore i_1 = 0.1172 \text{ Amp}$$

$$i_2 = 0.01379 \text{ Amp}$$

$$\boxed{i_1 = 0.245}$$

$$i_1 = 0.245 \text{ A} ; i_2 = 0.407 \text{ A} ; i_3 = 0.536 \text{ A}$$

EIGEN VALUES - EIGEN VECTORS

AND QUADRATIC FORM

Def: Let A be an $n \times n$ matrix, there exists a non-zero vector x such that $Ax = \lambda x$ then λ is called Eigen value of the matrix and corresponding vector x is called Eigen vector.

Eigen values are also called as proper values (&) Latent values (&) Spectral values (or) characteristic values.

Eigen vectors also called as proper vectors (or) Latent vectors (&) Spectral vectors (&) characteristic vectors.

PROCEDURE TO FIND EIGEN VALUES OF A MATRIX

Let A be an $n \times n$ matrix and λ be the Eigen value of A and x be the corresponding Eigen vector.

By the definition, we have $Ax = \lambda x$ ($x \neq 0$)

$$\Rightarrow Ax - \lambda Ix = 0$$

$$\Rightarrow (A - \lambda I)x = 0$$

which is a homogeneous system of equations.

The system possess non-zero solutions if the coefficient matrix is singular.

$$\text{i.e. if } |A - \lambda I| = 0$$

$|A - \lambda I| = 0$ is called characteristic Equation.

$(A - \lambda I)$ is called characteristic polynomial.

- (1) Let the matrix $A = [a_{ij}]_{n \times n}$
- (2) Write the characteristic Equation $|A - \lambda I| = 0$
- (3) Solve the Equation, we get 'n' roots
- (4) At each $\lambda = \lambda_i$, we solve the Equation $(A - \lambda_i I)x = 0$
we get the corresponding vectors.

Find the Eigen values and Eigen vectors of the matrix

$$A = \begin{bmatrix} 4 & 2 \\ 1 & 5 \end{bmatrix}$$

Soln:

Given matrix is $A = \begin{bmatrix} 4 & 2 \\ 1 & 5 \end{bmatrix}$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$= \begin{vmatrix} 4-\lambda & 2 \\ 1 & 5-\lambda \end{vmatrix} = 0$$

$$= (4-\lambda)(5-\lambda) - 2 = 0$$

$$= 20 - 9\lambda + \lambda^2 - 2 = 0$$

$$= \lambda^2 - 9\lambda + 18 = 0$$

$$= \lambda^2 - 6\lambda - 3\lambda + 18 = 0$$

$$= \lambda(\lambda-6) - 3(\lambda-6) = 0$$

$$= (\lambda-3)(\lambda-6) = 0$$

$$= \lambda = 3, 6$$

$\therefore$ The Eigen values of A are 3, 6.

To find Eigen vectors of A corresponding to Eigen values

Consider $(A - \lambda I)x = 0$ Here $x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$

$$\text{ie } \begin{bmatrix} 4-\lambda & 2 \\ 1 & 5-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \quad \text{--- (1)}$$

The Eigen vector X is given by $(A-3I)X=0$

$$\begin{bmatrix} 4-3 & 2 \\ 1 & 5-3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The coefficient matrix is in Echelon form.

The rank of the matrix $= r = 1$

number of unknowns $(n) = 2$

$$n-r = 2-1 = 1$$

Give arbitrary constant to one variable

$$\text{let } x_2 = K$$

$$x_1 + 2x_2 = 0$$

$$x_1 + 2K = 0$$

$$x_1 = -2K$$

$$\therefore X = \begin{bmatrix} -2K \\ K \end{bmatrix} = K \begin{bmatrix} -2 \\ 1 \end{bmatrix} \text{ where } K \neq 0$$

$\therefore \begin{bmatrix} -2 \\ 1 \end{bmatrix}$ is the Eigen vector of A corresponding to the Eigen value $\lambda = 3$

Case ii, $\lambda = 6$

The Eigen vector X is given by $(A-6I)X=0$

$$\begin{bmatrix} 4-6 & 2 \\ 1 & 5-6 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 2 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$R_1: \frac{R_1}{-2} \quad \begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The coefficient matrix is in Echelon form

The rank of the coefficient matrix $(r) = 1$

number of unknowns $(n) = 2$

$$n - r = 2 - 1 = 1$$

Give arbitrary constant to one variable

$$x_1 - x_2 = 0 \quad \text{--- (1)}$$

$$\text{let } x_2 = k \quad \text{--- (2)}$$

$$\therefore x_1 - k = 0$$

$$\Rightarrow x_1 = k$$

$$\therefore x_2 = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} k \\ k \end{bmatrix} = k \begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \text{where } k \neq 0$$

$\therefore \begin{bmatrix} 1 \\ 1 \end{bmatrix}$ is the Eigen vector of A corresponding to

Eigen value $\lambda = 6$.

Find the characteristic roots and the corresponding characteristic vectors of the matrix

$$\begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$$

Soln: let $A = \begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$

The characteristic equation of A is $|A - \lambda I| = 0$

$$\text{i.e. } \begin{vmatrix} 6-\lambda & -2 & 2 \\ -2 & 3-\lambda & -1 \\ 2 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$R_2: R_2 + R_3$$

$$\begin{vmatrix} 6-\lambda & -2 & 2 \\ -2+2 & 3-\lambda-1 & -1+3-\lambda \\ 2 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} 6-\lambda & 0 & 2 \\ 0 & 2-\lambda & 2-\lambda \\ 2 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$= (2-\lambda) \begin{vmatrix} 6-\lambda & -2 & 2 \\ 0 & 1 & 1 \\ 2 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$= 2-\lambda=0 \quad \& \quad \begin{vmatrix} 6-\lambda & -2 & 2 \\ 0 & 1 & 1 \\ 2 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow 2=\lambda \quad \& \quad (6-\lambda) \begin{vmatrix} 1 & 1 \\ -1 & 3-\lambda \end{vmatrix} + 2 \begin{vmatrix} -2 & 2 \\ 1 & 1 \end{vmatrix} = 0$$

$$\Rightarrow (6-\lambda) [3-\lambda+1] + 2 [-2-2] = 0$$

$$\Rightarrow (6-\lambda) [4-\lambda] + 2(-4) = 0$$

$$\Rightarrow 24 - 6\lambda - 4\lambda + \lambda^2 - 8 = 0$$

$$\Rightarrow \lambda^2 - 10\lambda + 16 = 0$$

$$\Rightarrow \lambda^2 - 8\lambda - 2\lambda + 16 = 0$$

$$\Rightarrow \lambda(\lambda-8) - 2(\lambda-8) = 0$$

$$\Rightarrow (\lambda-2)(\lambda-8) = 0$$

$$\Rightarrow \lambda = 2 \& 8$$

$$\therefore \lambda = 2, 2, 8$$

$\therefore$ Eigen values are 2, 2, 8.

Consider $(A - \lambda I)X = 0$ Here $X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$

$$\begin{bmatrix} 6-\lambda & -2 & 2 \\ -2 & 3-\lambda & -1 \\ 2 & -1 & 3-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{--- (1)}$$

Case i, $\lambda = 2$

The Eigen vector X of A is given by

$$(A - 2I)X = 0$$

$$\begin{bmatrix} 6-2 & -2 & 2 \\ -2 & 3-2 & -1 \\ 2 & -1 & 3-2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 4 & -2 & 2 \\ -2 & 1 & -1 \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_1: \frac{R_1}{4} \quad \begin{bmatrix} 1 & -\frac{1}{2} & \frac{1}{2} \\ -2 & 1 & -1 \\ 2 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2: R_2 + 2R_1 \quad ; \quad R_3: R_3 - 2R_1$$

$$\begin{bmatrix} 1 & -\frac{1}{2} & \frac{1}{2} \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The coefficient matrix is in Echelon form.

coefficient matrix rank $(r) = 1$

number of unknowns $(n) = 3$

$$n - r = 3 - 1 = 2$$

Give arbitrary constants to two variables

$$x_1 - \frac{1}{2}x_2 + \frac{1}{2}x_3 = 0 \quad \text{--- (2)}$$

$$x_3 = k_1 \quad \text{--- (3)}$$

$$x_2 = k_2 \quad \text{--- (4)}$$

$$x_1 - \frac{1}{2}k_2 + \frac{1}{2}k_1 = 0$$

$$\Rightarrow x_1 = -\frac{1}{2}k_1 + \frac{1}{2}k_2$$

$$\therefore X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -\frac{1}{2}k_1 + \frac{1}{2}k_2 \\ k_2 \\ k_1 \end{bmatrix}$$

$$= \begin{bmatrix} -\frac{1}{2}k_1 \\ 0 \\ k_1 \end{bmatrix} + \begin{bmatrix} \frac{1}{2}k_2 \\ k_2 \\ 0 \end{bmatrix}$$

$$= k_1 \begin{bmatrix} -\frac{1}{2} \\ 0 \\ 1 \end{bmatrix} + k_2 \begin{bmatrix} \frac{1}{2} \\ 1 \\ 0 \end{bmatrix}$$

$X_1 \qquad X_2$

$\therefore$ The Eigen vectors of A corresponding to $\lambda=2$

$$R_2: \frac{R_2}{-3}$$

$$\begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 1 \\ 0 & -3 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_3: R_3 + 3R_2$$

$$\begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The coefficient matrix is in Echelon form

Coefficient matrix rank (r) = 2

number of unknowns (n) = 3

$$n - r = 3 - 2 = 1$$

Give arbitrary constant to one variable

$$x_1 + x_2 - x_3 = 0 \quad \text{--- (5)}$$

$$x_2 + x_3 = 0 \quad \text{--- (6)}$$

$$\text{Let } x_3 = k \quad \text{--- (7)}$$

$$x_2 + k = 0$$

$$\Rightarrow \boxed{x_2 = -k}$$

$$x_1 - k - k = 0$$

$$\Rightarrow x_1 = -2k$$

$$\therefore X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -2k \\ -k \\ k \end{bmatrix} = k \begin{bmatrix} -2 \\ -1 \\ 1 \end{bmatrix}$$

$X_3 = \begin{bmatrix} -2 \\ -1 \\ 1 \end{bmatrix}$ is the eigenvector of A corresponding to Eigenvalue $\lambda = 8$

- ① if λ is a Eigen value of matrix A corresponding to the Eigen vector x , then λ^v is the Eigen value of A^v corresponding to the Eigen vector x .

proof:- if λ is Eigen value of a matrix A , then $AX = \lambda X$ ——— ①
pre multiply Equation ① with matrix A , we get

$$A(AX) = A(\lambda X)$$

$$\Rightarrow A^v X = A \lambda X$$

$$\Rightarrow A^v X = \lambda (AX)$$

$$\Rightarrow A^v X = \lambda (\lambda X)$$

From ①

$$\Rightarrow A^v X = \lambda^v X$$

$$\Rightarrow \lambda^v \text{ is the Eigen value of } A^v.$$

- ② if λ is a Eigen value of the matrix A then $K\lambda$ is a Eigen value of KA corresponding to same Eigen vector x .

proof:- if λ is Eigen value of a matrix A then $AX = \lambda X$ ——— ①
Multiply Equation ① with K ($K \neq 0$) on both sides

$$(KA)X = (K\lambda)X$$

$$\Rightarrow K\lambda \text{ is a Eigen value of } KA$$

- ③ The matrix A and A^T have same Eigen values

proof:- let λ be a Eigen value of A then $AX = \lambda X$
and it satisfy $|A - \lambda I| = 0$ ——— ①

$$\text{Take } (A - \lambda I)^T = A^T - (\lambda I)^T = A^T - \lambda I^T = A^T - \lambda I$$

$$|A - \lambda I|^T = |A^T - \lambda I|$$

$$\Rightarrow |A - \lambda I| = |A^T - \lambda I|$$

$$\therefore |A| = |A^T|$$

$$\Rightarrow \lambda \text{ is the Eigen value of } A^T$$

From ①

- ④ If $\lambda_1, \lambda_2, \dots, \lambda_n$ are the Eigen values of A then $\lambda_1^n, \lambda_2^n, \dots, \lambda_n^n$ are Eigen values of A^n .

proof: If A is $n \times n$ matrix and $\lambda_1, \lambda_2, \dots, \lambda_n$ are Eigen values of matrix A then $Ax_i = \lambda_i x_i$ ($i = 1, 2, \dots, n$)

————— ①
Multiplying Equation ① with " A " on both sides

$$\begin{aligned} A(Ax_i) &= A(\lambda_i x_i) \\ &= A^2 x_i = \lambda_i (Ax_i) \\ &= A^2 x_i = \lambda_i (\lambda_i x_i) \quad (\text{From ①}) \\ &= A^2 x_i = \lambda_i^2 x_i \quad \text{————— ②} \end{aligned}$$

Again multiplying Equation ② with A on both sides

$$\begin{aligned} A(A^2 x_i) &= A(\lambda_i^2 x_i) \\ &= A^3 x_i = \lambda_i^2 (Ax_i) \\ &= A^3 x_i = \lambda_i^2 (\lambda_i x_i) \\ &= A^3 x_i = \lambda_i^3 x_i \quad \text{————— ③} \end{aligned}$$

Repeat above process of " n " times, we get

$$A^n x_i = \lambda_i^n x_i$$

$\therefore \lambda_1^n, \lambda_2^n, \dots, \lambda_n^n$ are Eigen values of A^n .

- ⑤ If x is a Eigen vector of A then x cannot correspond to more than one Eigen value.

proof: Let λ_1, λ_2 be two Eigen values of A corresponding to same Eigen vector x then

$$Ax = \lambda_1 x \quad \text{————— ①}$$

$$Ax = \lambda_2 x \quad \text{————— ②}$$

From ① & ②, we have

$$\lambda_1 x = \lambda_2 x$$

$$\Rightarrow \lambda_1 x - \lambda_2 x = 0$$

$$\Rightarrow (\lambda_1 - \lambda_2)x = 0$$

Since x is non-zero vector

$$\therefore \lambda_1 - \lambda_2 = 0$$

$$\Rightarrow \lambda_1 = \lambda_2$$

$\therefore x$ cannot correspond to more than one Eigen value

⑥ if $\lambda_1, \lambda_2, \dots, \lambda_n$ are the Eigen values of A then

$\frac{1}{\lambda_1}, \frac{1}{\lambda_2}, \dots, \frac{1}{\lambda_n}$ are the Eigen values of A^{-1}

proof:- if A is $n \times n$ matrix and $\lambda_1, \lambda_2, \dots, \lambda_n$ are the Eigen value of A then $AX_i = \lambda_i X_i$ ($i=1, 2, \dots, n$)

multiplying Equation ① by A^{-1} on both sides

$$A^{-1}(AX_i) = A^{-1}(\lambda_i X_i)$$

$$\Rightarrow (A^{-1}A)X_i = \lambda_i (A^{-1}X_i)$$

$$\Rightarrow IX_i = \lambda_i (A^{-1}X_i)$$

$$\Rightarrow \frac{1}{\lambda_i} X_i = A^{-1}X_i$$

$$\Rightarrow A^{-1}X_i = \frac{1}{\lambda_i} X_i$$

$\therefore \frac{1}{\lambda_i}$ are the Eigen values of A^{-1} ($i=1, 2, \dots, n$)

$\therefore \frac{1}{\lambda_1}, \frac{1}{\lambda_2}, \dots, \frac{1}{\lambda_n}$ are the Eigen values of A^{-1} .

⑦ The Eigen values of diagonal matrix are its diagonal elements

Soln:-

Let A be the diagonal matrix of order n

$$\therefore A = \begin{bmatrix} a_{11} & 0 & \dots & 0 \\ 0 & a_{22} & \dots & 0 \\ - & - & - & - \\ 0 & 0 & \dots & a_{nn} \end{bmatrix}$$

$$\Rightarrow \begin{vmatrix} a_{11}-\lambda & 0 & \dots & 0 \\ 0 & a_{22}-\lambda & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & a_{nn}-\lambda \end{vmatrix} = 0$$

$$= (a_{11}-\lambda)(a_{22}-\lambda)\dots(a_{nn}-\lambda) = 0$$

$\Rightarrow \lambda = a_{11}, a_{22}, \dots, a_{nn}$ are the diagonal elements of the matrix A.

(8) The Eigen values of triangular matrix are its diagonal elements.

Proof Case i, Let A be an upper triangular matrix of order 3.

$$\text{Let } A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ 0 & a_{22} & a_{23} \\ 0 & 0 & a_{33} \end{bmatrix}$$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} a_{11}-\lambda & a_{12} & a_{13} \\ 0 & a_{22}-\lambda & a_{23} \\ 0 & 0 & a_{33}-\lambda \end{vmatrix} = 0$$

$$= (a_{11}-\lambda)(a_{22}-\lambda)(a_{33}-\lambda) = 0$$

$\Rightarrow \lambda = a_{11}, a_{22}, a_{33}$ are the diagonal elements of the matrix A.

Case ii, Let A be the Lower triangular matrix of order 3

$$\text{Let } A = \begin{bmatrix} a_{11} & 0 & 0 \\ a_{21} & a_{22} & 0 \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

characteristic Equation of A is $|A - \lambda I| = 0$

$$\begin{vmatrix} a_{11}-\lambda & 0 & 0 \\ a_{21} & a_{22}-\lambda & 0 \\ a_{31} & a_{32} & a_{33}-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (a_{11}-\lambda)(a_{22}-\lambda)(a_{33}-\lambda) = 0$$

$\Rightarrow \lambda = a_{11}, a_{22}, a_{33}$ are the diagonal elements of the matrix A.

$\therefore$ The Eigen values of any triangular matrix are its diagonal elements.

Similar matrix: Two matrices A and B are said to be similar if $B = P^{-1}AP$ where P is a non-singular matrix.

⑨ Eigen values of two similar matrices are same.

Proof: Let A and B be two similar matrices
So that $B = P^{-1}AP$

To prove that A and $P^{-1}AP$ have the same Eigen values.

Let λ be the Eigen value of B then $|B - \lambda I| = 0$

$$\Rightarrow |P^{-1}AP - \lambda I| = 0$$

$$\Rightarrow |P^{-1}AP - \lambda P^{-1}P| = 0$$

$$\Rightarrow |P(A - \lambda I)P^{-1}| = 0$$

$$\Rightarrow |P| |A - \lambda I| |P^{-1}| = 0$$

$$\Rightarrow |P| |P^{-1}| |A - \lambda I| = 0$$

$$\Rightarrow 1 |A - \lambda I| = 0$$

$$\Rightarrow |A - \lambda I| = 0$$

$$\therefore |P| |P^{-1}| = 1$$

Hence A and B have the same Eigen values.

- (10) If A and B are two square invertible matrices then BA and AB have the same Eigen values.

Proof:

$$\begin{aligned} AB &= IAB \\ &= (\bar{B}^T B)AB \\ &= \bar{B}^T (BA)B \end{aligned}$$

$$AB = \bar{B}^T (BA)B \quad \text{--- (1)}$$

By the property (9), matrices AB , and $\bar{B}^T (BA)B$ have the same Eigen values.

Now by (1), the matrices AB and BA have the same Eigen values.

- (11) If λ is a Eigen values of A then $\frac{|A|}{\lambda}$ is also Eigen value of $\text{adj } A$.

Proof: If λ is the Eigen value of A then $Ax = \lambda x$ --- (1)

Multiply Equation (1) with $\text{adj } A$ on both sides

$$(\text{adj } A)Ax = (\text{adj } A)\lambda x$$

$$\Rightarrow (\text{adj } A \cdot A)x = \lambda (\text{adj } A)x$$

$$\Rightarrow |A|x = \lambda (\text{adj } A)x$$

$$\Rightarrow \frac{|A|}{\lambda} x = (\text{adj } A)x$$

$$\Rightarrow (\text{adj } A)x = \frac{|A|}{\lambda} x$$

$$\Rightarrow \frac{|A|}{\lambda} \text{ is a Eigen value of } \text{adj } A.$$

12. The product of the Eigen values of a matrix A is Equal to its determinant

proof: Let $\lambda_1, \lambda_2, \dots, \lambda_n$ be the Eigen values of $A_{n \times n}$

$$\text{then } |A - \lambda I| = (-1)^n (\lambda - \lambda_1)(\lambda - \lambda_2) \dots (\lambda - \lambda_n) = 0$$

$$\text{put } \lambda = 0$$

$$|A| = (-1)^n (-\lambda_1)(-\lambda_2) \dots (-\lambda_n)$$

$$\Rightarrow |A| = (-1)^n (-1)^n \lambda_1 \lambda_2 \dots \lambda_n$$

$$\Rightarrow |A| = (-1)^{2n} \lambda_1 \lambda_2 \dots \lambda_n$$

$$\Rightarrow |A| = \lambda_1 \lambda_2 \dots \lambda_n$$

The product of the Eigen values of a matrix A is Equal to its determinant

13. The Sum of the Eigen values of a matrix is its trace of the matrix.

proof: Let $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$ be a square matrix of order 3.

Let λ be the Eigen value of the matrix

The characteristic equation is

$$|A - \lambda I| = 0$$

$$\Rightarrow \begin{vmatrix} a_{11} - \lambda & a_{12} & a_{13} \\ a_{21} & a_{22} - \lambda & a_{23} \\ a_{31} & a_{32} & a_{33} - \lambda \end{vmatrix} = 0$$

$$+ a_{13} [a_{21}a_{32} - a_{31}(a_{22} - \lambda)] = 0$$

$$\Rightarrow (a_{11} - \lambda) [a_{21}a_{33} - a_{33}a_{21} + \lambda^2 - a_{22}a_{32}] - a_{12} [a_{21}a_{33} - a_{21}\lambda - a_{23}a_{31}] + a_{13} [a_{21}a_{32} - a_{31}a_{22} + a_{31}\lambda] = 0$$

$$\Rightarrow a_{11}a_{22}a_{33} - a_{11}a_{22}\lambda - a_{11}a_{23}\lambda + a_{11}\lambda^2 - a_{12}a_{21}a_{33} - a_{12}a_{23}\lambda + a_{12}\lambda^2 + a_{13}\lambda^2 - \lambda^3 + a_{23}a_{32}\lambda - a_{22}a_{21}a_{33} + a_{22}a_{21}\lambda + a_{22}a_{23}a_{31} + a_{23}a_{21}a_{32} - a_{23}a_{21}a_{32} + a_{23}a_{31}\lambda = 0$$

$$= -\lambda^3 + \lambda^2 (a_{11} + a_{22} + a_{33}) + \lambda (-a_{12}a_{21} - a_{11}a_{23} - a_{22}a_{31} + a_{23}a_{32} + a_{22}a_{21}) + (a_{11}a_{22}a_{33} - a_{11}a_{23}a_{32} - a_{12}a_{21}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32})$$

Sum of the Eigen values = Sum of roots = 0

$$= \frac{-[\text{coefficient of } \lambda^2]}{\text{coefficient of } \lambda^3}$$

$$= \frac{-(a_{11} + a_{22} + a_{33})}{1}$$

$$= a_{11} + a_{22} + a_{33}$$

= Sum of the diagonal elements of A

= Trace of A

Hence the Sum of the Eigen values of a matrix A is Equal to its Trace.

combination of the vectors $\bar{x}_1, \bar{x}_2, \bar{x}_3, \dots, \bar{x}_n$ etc if there exists scalars $k_1, k_2, \dots, k_n$ such that

$$\bar{x} = k_1\bar{x}_1 + k_2\bar{x}_2 + \dots + k_n\bar{x}_n$$

LINEARLY DEPENDENT : A set of vectors $\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n$ is said to be linearly dependent if there exists n scalars $k_1, k_2, \dots, k_n$ not all zero such that

$$\bar{0} = k_1\bar{x}_1 + k_2\bar{x}_2 + \dots + k_n\bar{x}_n = 0$$

where $\bar{0}$ denotes the n -vector whose components are all zero.

LINEARLY INDEPENDENT : A set of vectors $\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n$ is said to be linearly independent if every relation of the type $k_1\bar{x}_1 + k_2\bar{x}_2 + \dots + k_n\bar{x}_n = 0$ implies $k_1 = 0, k_2 = 0, \dots, k_n = 0$.

(16) Two distinct Eigen vectors corresponding to two distinct Eigen values are linearly independent.

Proof: Let x_1, x_2 be two distinct Eigen vectors of A corresponding to two distinct Eigen values λ_1, λ_2

$$\text{i.e. } \left. \begin{aligned} Ax_1 &= \lambda_1 x_1 \\ Ax_2 &= \lambda_2 x_2 \end{aligned} \right\} \text{--- (1)}$$

To prove that x_1 and x_2 are linearly independent. Suppose that x_1 and x_2 are linearly dependent.

Consider two constants c_1 and c_2 (none are zero's)

$$\text{Such that } c_1x_1 + c_2x_2 = 0 \text{ --- (2)}$$

... Multiply by A on both sides

$$A(c_1x_1) + A(c_2x_2) = 0$$

$$\Rightarrow c_1(Ax_1) + c_2(Ax_2) = 0$$

$$c_1(\lambda_1 x_1) + c_2(\lambda_2 x_2) = 0$$

$$\Rightarrow (c_1 \lambda_1) x_1 + (c_2 \lambda_2) x_2 = 0 \quad \text{--- (3)}$$

$$\textcircled{3} \Rightarrow (c_1 \lambda_1) x_1 + (c_2 \lambda_2) x_2 = 0$$

$$\textcircled{2} \times \lambda_2 \Rightarrow (c_1 \lambda_2) x_1 + (c_2 \lambda_2) x_2 = 0$$

$$\underline{c_1 \lambda_1 x_1 - c_1 \lambda_2 x_1 = 0}$$

$$\Rightarrow c_1(\lambda_1) x_1 - c_1(\lambda_2) x_1 = 0$$

$$= c_1[\lambda_1 - \lambda_2] x_1 = 0$$

$$\text{Since } x_1 \neq 0 ; \lambda_1 - \lambda_2 \neq 0$$

||y

$$\Rightarrow c_1 = 0$$

$$\textcircled{3} \Rightarrow (c_1 \lambda_1) x_1 + (c_2 \lambda_2) x_2 = 0$$

$$\textcircled{2} \times \lambda_1 \Rightarrow (c_1 \lambda_1) x_1 + (c_2 \lambda_1) x_2 = 0$$

$$\underline{c_2 \lambda_2 x_2 - c_2 \lambda_1 x_2 = 0}$$

$$= c_2[\lambda_2 - \lambda_1] x_2 = 0$$

$$\text{Since } x_2 \neq 0 ; \lambda_2 - \lambda_1 \neq 0$$

$$\therefore c_2 = 0$$

This is contradicts that our assumption that c_1 and c_2 are not zero.

$\therefore x_1$ and x_2 are linearly independent.

||y n distinct Eigen vectors corresponding to n distinct Eigen values are linearly independent.

NOTE: The Eigen vectors corresponding to repeated Eigen values may be linearly independent (or) linearly dependent.

Zero is Eigen value of a matrix if and only if it is Singular.

Proof:-

Let A be a matrix of order n

Let $\lambda = 0$ be the Eigen value of A then $|A - \lambda I| = 0$

$$\Rightarrow |A - (0)I| = 0$$

$$\Rightarrow |A| = 0$$

$\Rightarrow A$ is singular matrix

Suppose A is singular matrix

$$\Rightarrow |A| = 0$$

$$\Rightarrow |A - (0)I| = 0$$

$\Rightarrow 0$ is the Eigen value of A

$\therefore$ Zero is the Eigen value of a matrix iff it is singular.

(18) if λ is the Eigen value of A then the Eigen value of $B = a_0 A^2 + a_1 A + a_2 I$ is $a_0 \lambda^2 + a_1 \lambda + a_2$

Proof:-

λ is the Eigen value of $A \Rightarrow AX = \lambda X$ — (1)

Also λ^2 is the Eigen value of $A^2 \Rightarrow A^2 X = \lambda^2 X$ — (2)

$$\text{Now } B = a_0 A^2 + a_1 A + a_2 I$$

$$BX = (a_0 A^2 + a_1 A + a_2 I)X$$

$$\Rightarrow BX = a_0 A^2 X + a_1 A X + a_2 I X$$

$$\Rightarrow BX = (a_0 \lambda^2 X + a_1 \lambda X + a_2 X)$$

$$\Rightarrow BX = (a_0 \lambda^2 + a_1 \lambda + a_2) X$$

$\Rightarrow a_0 \lambda^2 + a_1 \lambda + a_2$ is the Eigen value of B

Hence if λ is the Eigen value of A then the Eigen

value of $B = a_0 A^2 + a_1 A + a_2 I$ is given by $a_0 \lambda^2 + a_1 \lambda + a_2$

Proof:

Let λ be the Eigen value of the matrix A and
Let X be the Eigen ~~value~~ vector of the matrix A
Such that $AX = \lambda X$ — (1)

$$\begin{aligned}\text{Now } (A + kI)X &= AX + kIX \\ &= \lambda X + kX \\ &= (\lambda + k)X\end{aligned}$$

$$\therefore (A + kI)X = (\lambda + k)X$$

$\therefore \lambda + k$ is the Eigen value of $A + kI$.

Q Determine the Eigen values of A^{-1} , where $A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$

Soln:

Given matrix is $A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} 1-\lambda & 0 & -1 \\ 1 & 2-\lambda & 1 \\ 2 & 2 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda) [(2-\lambda)(3-\lambda) - 2] + 1 [2 - 2(2-\lambda)]$$

$$= (1-\lambda) [6 - 2\lambda - 3\lambda + \lambda^2 - 2] + [2 - 4 + 2\lambda] = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2 - 5\lambda + 4] + [2\lambda - 2] = 0$$

$$= (1-\lambda) [\lambda^2 - 5\lambda + 4] + 2(1-\lambda) = 0$$

$$= (1-\lambda) [\lambda^2 - 5\lambda + 4 + 2] = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2 - 5\lambda + 6] = 0$$

$$\Rightarrow \lambda = 1, 2, 3$$

We know that λ is Eigen value of A then $\frac{1}{\lambda}$ is the Eigen value of A^{-1} . $\therefore$ The Eigen values of A are 1, 2, 3
The Eigen values of A^{-1} are $1, \frac{1}{2}, \frac{1}{3}$

Soln:

Given matrix is $A = \begin{bmatrix} 2 & 3 & 4 \\ 0 & 4 & 2 \\ 0 & 0 & 3 \end{bmatrix}$

The Eigen values of A are $\lambda = 2, 3, 4$

The Eigen values of $\text{adj } A$ are $\frac{|A|}{\lambda}$

NOW $|A| = 2(12) - 3(0) + 4(0)$

$\Rightarrow |A| = 24$

The Eigen values of $\text{adj } A$ are $\frac{24}{2}, \frac{24}{3}, \frac{24}{4}$
 $= 12, 8, 6$

if 2, 3, 5 are the Eigen values of A , then find the Eigen values of $2A^3 + 3A^2 + 5A + 3I$

Soln:

Given that the Eigen values of A are 2, 3, 5

By the property "if λ is the Eigen value of A then Eigen value of $a_0 A^3 + a_1 A^2 + a_2 A + a_3 I$ is $a_0 \lambda^3 + a_1 \lambda^2 + a_2 \lambda + a_3$ "

$\lambda = 2 \Rightarrow 2(2)^3 + 3(2)^2 + 5(2) + 3 = 41$

$\lambda = 3 \Rightarrow 2(3)^3 + 3(3)^2 + 5(3) + 3 = 99$

$\lambda = 5 \Rightarrow 2(5)^3 + 3(5)^2 + 5(5) + 3 = 353$

$\therefore$ Hence the Eigen values of $2A^3 + 3A^2 + 5A + 3I$ are 41, 99, 353.

Algebraic Multiplicity: if λ is an Eigen value of A repeated " r " times, then r is called algebraic multiplicity of the Eigen value λ .

Eg: if $A = \begin{bmatrix} -3 & -1 & -5 \\ 2 & 4 & 3 \\ 1 & 2 & 2 \end{bmatrix}$ then $|A - \lambda I| = (\lambda - 1)^3 = 0$

Algebraic multiplicity of $\lambda = 1$ is 3.

Geometric multiplicity: The number of linearly independent Eigenvectors corresponding to the repeated eigenvalues of λ of a matrix is called Geometric multiplicity

Eg: Now Eigen vector corresponding to $\lambda=1$ is $\begin{bmatrix} 3 \\ 1 \end{bmatrix}$
only one Eigen vector corresponding to $\lambda=1$

$\therefore$ Geometric multiplicity is one.

NOTE: Always Geometric multiplicity $\leq$ Algebraic multiplicity

CAYLEY - HAMILTON THEOREM

STATEMENT: Every square matrix satisfies its own characteristic Equation.

proof:

Let A be the square matrix of order n
 $\therefore A = [a_{ij}]_{n \times n}$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\text{Let } |A - \lambda I| = (-1)^n [\lambda^n + a_1 \lambda^{n-1} + a_2 \lambda^{n-2} + \dots + a_n] \quad \text{--- (1)}$$

We know that if the degree of $(A - \lambda I)$ is at most n
then the degree of $\text{adj}(A - \lambda I)$ is at most $(n-1)$ & less

$$\text{Let } \text{adj}(A - \lambda I) = B_0 \lambda^{n-1} + B_1 \lambda^{n-2} + B_2 \lambda^{n-3} + \dots + B_{n-2} \lambda + B_{n-1} \quad \text{--- (2)}$$

We know that

$$(A - \lambda I) \text{adj}(A - \lambda I) = |A - \lambda I| I \quad \text{--- (3)}$$

Substitute (1), (2) in (3), we get

$$(A - \lambda I) [B_0 \lambda^{n-1} + B_1 \lambda^{n-2} + \dots + B_{n-2} \lambda + B_{n-1}] = (-1)^n [\lambda^n + a_1 \lambda^{n-1} + a_2 \lambda^{n-2} + \dots + a_n] I$$

$$\Rightarrow AB_0 \lambda^{n-1} + AB_1 \lambda^{n-2} + \dots + AB_{n-2} \lambda + AB_{n-1} - \lambda^n B_0 - \lambda^{n-1} B_1 - \dots - \lambda^n B_{n-2} - \lambda^{n-1} B_{n-1} = (-1)^n \lambda^n I + (-1)^n a_1 \lambda^{n-1} I + (-1)^n a_2 \lambda^{n-2} I + \dots + (-1)^n a_n I$$

$$= -\lambda B_0 + \lambda (AB_0 - B_1) + \dots + \lambda (AB_{n-2} - B_{n-1}) + AB_{n-1}$$

$$= (-1)^n \lambda^n I + \lambda^{n-1} (-1)^{n-1} a_1 I + \dots + (-1)^1 a_n I$$

Equating coefficients on both sides

coefficients of λ^n

$$-B_0 = (-1)^n I \quad \text{--- (4)}$$

coefficients of λ^{n-1}

$$AB_0 - B_1 = (-1)^{n-1} a_1 I \quad \text{--- (5)}$$

constant

$$AB_{n-1} = (-1)^1 a_n I \quad \text{--- (6)}$$

$$\begin{aligned} \text{(4)} \times A^n &\Rightarrow -A^n B_0 = (-1)^n I A^n \\ &\Rightarrow -A^n B_0 = (-1)^n A^n \quad \text{--- (7)} \end{aligned}$$

$$\begin{aligned} \text{(5)} \times A^{n-1} &\Rightarrow A^{n-1} (AB_0 - B_1) = A^{n-1} [(-1)^{n-1} a_1 I] \\ &\Rightarrow A^n B_0 - A^{n-1} B_1 = (-1)^{n-1} a_1 A^{n-1} \quad \text{--- (8)} \end{aligned}$$

$$\begin{aligned} \text{(6)} \times I &\Rightarrow I (AB_{n-1}) = I [(-1)^1 a_n I] \\ &\Rightarrow AB_{n-1} = (-1)^1 a_n I \quad \text{--- (9)} \end{aligned}$$

Adding (7), (8) ----- (9), we get

$$\begin{aligned} -A^n B_0 + A^n B_0 - A^{n-1} B_1 + \dots + AB_{n-1} \\ = (-1)^n A^n + (-1)^{n-1} a_1 A^{n-1} + \dots + (-1)^1 a_n I \end{aligned}$$

$$\Rightarrow 0 = (-1)^n [A^n + a_1 A^{n-1} + \dots + a_n I]$$

$$(-1)^n [A^n + a_1 A^{n-1} + \dots + a_n I] = 0$$

Hence, A satisfies its characteristic equation.

APPLICATIONS OF CAYLEY-HAMILTON THEOREM

The Important applications of Cayley-Hamilton theorem

- i) TO find the Inverse of a matrix
- ii) TO find higher powers of the matrix

Verify Cayley-Hamilton theorem for the matrix $A = \begin{bmatrix} 1 & 0 & 3 \\ 2 & 1 & -1 \\ 1 & -1 & 1 \end{bmatrix}$
hence find A^{-1} and A^4

Soln: Given matrix is $A = \begin{bmatrix} 1 & 0 & 3 \\ 2 & 1 & -1 \\ 1 & -1 & 1 \end{bmatrix}$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\begin{vmatrix} 1-\lambda & 0 & 3 \\ 2 & 1-\lambda & -1 \\ 1 & -1 & 1-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda) [(1-\lambda)(-1) + 3(-2-1+\lambda)] = 0$$

$$\Rightarrow (1-\lambda) [1+\lambda^2-2\lambda-1] + 3[-3+\lambda] = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2-2\lambda] - 9+3\lambda = 0$$

$$\Rightarrow \lambda^2-2\lambda-\lambda^3+2\lambda^2-9+3\lambda = 0$$

$$\Rightarrow -\lambda^3+3\lambda^2+\lambda-9 = 0$$

$$\Rightarrow \lambda^3-3\lambda^2-\lambda+9 = 0$$

To verify the Cayley-Hamilton theorem, we have to show that $A^3-3A^2-A+9I = 0$

Verification

$$A^2 = A \cdot A = \begin{bmatrix} 1 & 0 & 3 \\ 2 & 1 & -1 \\ 1 & -1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 3 \\ 2 & 1 & -1 \\ 1 & -1 & 1 \end{bmatrix}$$

$$A^2 = \begin{bmatrix} 4 & -3 & 6 \\ 3 & 2 & 4 \\ 0 & -2 & 5 \end{bmatrix}$$

$$A^3 = A^2 \cdot A = \begin{bmatrix} 4 & -3 & 6 \\ 3 & 2 & 4 \\ 0 & -2 & 5 \end{bmatrix} \begin{bmatrix} 1 & 0 & 3 \\ 2 & 1 & -1 \\ 1 & -1 & 1 \end{bmatrix} = \begin{bmatrix} 4 & -9 & 21 \\ 11 & -2 & 11 \\ 1 & -7 & 7 \end{bmatrix}$$

$$A^3 - 3A^2 - A + 9I$$

$$= \begin{bmatrix} 4 & -9 & 21 \\ 11 & 2 & -11 \\ 1 & -7 & 7 \end{bmatrix} + \begin{bmatrix} -12 & 9 & -18 \\ -9 & -6 & -12 \\ 0 & 6 & -15 \end{bmatrix} + \begin{bmatrix} -1 & 0 & -3 \\ -2 & -1 & 1 \\ -1 & 1 & -1 \end{bmatrix} + \begin{bmatrix} 9 & 0 & 0 \\ 0 & 9 & 0 \\ 0 & 0 & 9 \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} = 0$$

Hence Cayley-Hamilton Theorem is verified.

To find A^{-1}

$$|A| = 1(1-1) - 3(-2-1) = 9 \neq 0$$

$\Rightarrow A^{-1}$ exists

$$\text{Since } A^3 - 3A^2 - A + 9I = 0$$

Multiplying with A^{-1}

$$A^{-1}(A^3 - 3A^2 - A + 9I) = 0$$

$$\Rightarrow A^2 - 3A - I + 9A^{-1} = 0$$

$$\Rightarrow 9A^{-1} = -A^2 + 3A + I$$

$$\Rightarrow 9A^{-1} = \begin{bmatrix} -4 & 3 & -6 \\ -3 & -2 & -4 \\ 0 & 2 & -5 \end{bmatrix} + \begin{bmatrix} 3 & 0 & 9 \\ 6 & 3 & -3 \\ 3 & -3 & 3 \end{bmatrix} + \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 0 & 3 & 3 \\ 3 & 2 & -7 \\ 3 & -1 & -1 \end{bmatrix}$$

$$\Rightarrow A^{-1} = \frac{1}{9} \begin{bmatrix} 0 & 3 & 3 \\ 3 & 2 & -7 \\ 3 & -1 & -1 \end{bmatrix}$$

To find A^4

$$\text{Since } A^3 - 3A^2 - A + 9I = 0$$

Multiplying by A

$$A(A^3 - 3A^2 - A + 9I) = 0$$

$$\Rightarrow A^4 - 3A^3 - A^2 + 9A = 0$$

$$\Rightarrow A^4 = 3A^3 + A^2 - 9A$$

$$A^4 = \begin{bmatrix} 12 & -21 & 63 \\ 33 & -6 & 33 \\ 3 & -21 & 21 \end{bmatrix} + \begin{bmatrix} 4 & -3 & 6 \\ 3 & 2 & 4 \\ 0 & -2 & 5 \end{bmatrix} + \begin{bmatrix} 29 & 0 & -27 \\ -18 & -9 & 9 \\ -9 & 9 & -9 \end{bmatrix} = \begin{bmatrix} 45 & -30 & 42 \\ 18 & -13 & 46 \\ -6 & -14 & 17 \end{bmatrix}$$

A matrix 'A' is said to be diagonalizable if it is similar to a diagonal matrix.

i.e. if there exist an invertible matrix P such that

$$D = P^{-1}AP \text{ where } D \text{ is a diagonal matrix.}$$

The matrix P is said to diagonalize A.

Working rule

1. Let the given matrix be $A = [a_{ij}]_{n \times n}$
2. Find the Eigen values of A
3. Find the Eigen vectors corresponding to Eigen value of A
4. choose the Modal matrix $P = [x_1 x_2 \dots x_n]$
5. calculate $P^{-1} = \frac{\text{adj } P}{|P|}$
6. calculate $P^{-1}AP = D$, where D is the diagonal matrix whose diagonal elements are Eigen values of A

Powers of matrix A^n if A is diagonalizable

$$\text{then } D = P^{-1}AP$$

$$D^2 = P^{-1}A^2P$$

$$D^3 = P^{-1}A^3P$$

$$\text{Hence } D^n = P^{-1}A^nP \quad \text{--- (1)}$$

To obtain A^n , pre-multiply (1) by P and post multiply by P^{-1} ;

$$PD^nP^{-1} = PP^{-1}A^nPP^{-1}$$

$$= PD^nP^{-1} = I A^n I$$

$$= PD^nP^{-1} = A^n$$

$$\therefore \boxed{A^n = PD^nP^{-1}}$$

Diagonalize the matrix $A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$ and find A^{-1}

Soln:

Given matrix is $A = \begin{bmatrix} 1 & 0 & -1 \\ 1 & 2 & 1 \\ 2 & 2 & 3 \end{bmatrix}$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} 1-\lambda & 0 & -1 \\ 1 & 2-\lambda & 1 \\ 2 & 2 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda) [(2-\lambda)(3-\lambda)-2] - 1[2-2(2-\lambda)] = 0$$

$$\Rightarrow (1-\lambda) [6-5\lambda+\lambda^2-2] - 1[2-4+2\lambda] = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2-5\lambda+4] - 1[-2+2\lambda] = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2-5\lambda+4] - 1(-2) [1-\lambda] = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2-5\lambda+4] + 2(1-\lambda) = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2-5\lambda+4+2] = 0$$

$$\Rightarrow (1-\lambda) (\lambda^2-5\lambda+6) = 0$$

$$\Rightarrow (1-\lambda) (\lambda-2)(\lambda-3) = 0$$

$$\Rightarrow \lambda = 1, 2, 3$$

Thus the Eigen values of A are $\lambda = 1, 2, 3$

To find the Eigen vectors of A corresponding to Eigen values:

consider $(A - \lambda I)X = 0$ Here $X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$

$$\text{i.e. } \begin{bmatrix} 1-\lambda & 0 & -1 \\ 1 & 2-\lambda & 1 \\ 2 & 2 & 3-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{--- (1)}$$

case i, $\lambda = 1$

$$\begin{bmatrix} 1-1 & 0 & -1 \\ 1 & 2-1 & 1 \\ 2 & 2 & 3-1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 2 & 2 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$R_1 \rightarrow R_2$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & -1 \\ 2 & 2 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_3: R_3 - 2R_1$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & -1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\text{rank}(A) = 2$$

$$n = 3$$

$$n - r = 3 - 2 = 1$$

Give arbitrary constant to one variable

$$-x_3 = 0$$

$$\Rightarrow x_3 = 0 \quad \text{--- (2)}$$

$$x_1 + x_2 + x_3 = 0 \quad \text{--- (3)}$$

$$\text{let } x_2 = k \quad \text{--- (4)}$$

$$x_1 + k + 0 = 0$$

$$\Rightarrow x_1 = -k$$

$$X_1 = \begin{bmatrix} -k \\ k \\ 0 \end{bmatrix} = k \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

Hence $X_1 = \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$ is Eigen vector of A corresponding to the Eigen value $\lambda = 1$

Case ii, $\lambda = 2$

$$\begin{bmatrix} 1-2 & 0 & -1 \\ 1 & 2-2 & 1 \\ 2 & 2 & 3-2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 & -1 \\ 1 & 0 & 1 \\ 2 & 2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 0 & -1 \\ 1 & -1 & 1 \\ 2 & 0 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -3 & 0 \\ 1 & 2-3 & 1 \\ 2 & 2 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Case III: $\lambda = 3$

to the eigen value $\lambda = 2$

$\therefore X_2 = \begin{bmatrix} 2 \\ 1 \\ -2 \end{bmatrix}$ is the eigen vector of A corresponding

$$X_2 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} k \\ k/2 \\ -k \end{bmatrix} = \begin{bmatrix} 2k \\ k \\ -2k \end{bmatrix} = k \begin{bmatrix} 2 \\ 1 \\ -2 \end{bmatrix}$$

$$x_1 + x_3 = 0 \Rightarrow x_1 = -x_3$$

$$\Rightarrow x_2 = k/2$$

$$2x_2 - k = 0$$

$$x_3 = k \quad \text{--- (1)}$$

$$2x_2 - x_3 = 0 \quad \text{--- (6)}$$

$$x_1 + x_3 = 0 \quad \text{--- (5)}$$

$$n - 1 = 3 - 2 = 1$$

$$n = 3$$

$$\text{rank}(A) = 2$$

$$\begin{bmatrix} 1 & 0 & 1 \\ 0 & 2 & -1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$R_2 \leftrightarrow R_3$

$$\begin{bmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 0 & 2 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$R_3: R_3 - 2R_1$

$$\begin{bmatrix} 1 & 0 & 1 \\ 0 & 0 & 0 \\ 2 & 2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$R_2: R_2 + R_1$

$$\begin{bmatrix} 1 & 0 & 1 \\ -1 & 0 & -1 \\ 2 & 2 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$R_1 \leftrightarrow R_2$

$$\begin{bmatrix} -1 & 1 & 1 \\ -2 & 0 & -1 \\ 2 & 2 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2: R_2 + 2R_1$$

$$\begin{bmatrix} 1 & -1 & 1 \\ 0 & -2 & 1 \\ 2 & 2 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_3: R_3 - 2R_1$$

$$\begin{bmatrix} 1 & -1 & 1 \\ 0 & -2 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\text{rank}(A) = 2$$

$$n = 3$$

$$n - r = 3 - 2 = 1$$

$$x_1 - x_2 + x_3 = 0 \quad \text{--- (8)}$$

$$-2x_2 + x_3 = 0 \quad \text{--- (9)}$$

$$\text{let } x_3 = k \quad \text{--- (10)}$$

$$-2x_2 + k = 0$$

$$\Rightarrow -2x_2 = -k$$

$$\Rightarrow \boxed{x_2 = \frac{k}{2}}$$

$$x_1 - \frac{k}{2} + k = 0$$

$$\Rightarrow x_1 + \frac{k}{2} = 0$$

$$\Rightarrow x_1 = -\frac{k}{2}$$

$$X_3 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -\frac{k}{2} \\ \frac{k}{2} \\ k \end{bmatrix} = \frac{k}{2} \begin{bmatrix} -1 \\ 1 \\ 2 \end{bmatrix}$$

$\therefore X_3 = \begin{bmatrix} -1 \\ 1 \\ 2 \end{bmatrix}$ is the Eigen vector of A corresponding to Eigen value $\lambda = 3$.

$$\text{Modal matrix } P = [X_1 \ X_2 \ X_3] = \begin{bmatrix} -1 & -2 & -1 \\ 1 & 1 & 1 \\ 0 & 2 & 2 \end{bmatrix}$$

$$|P| = -1[2-2] + 2[2-0] - 1[2-0] = 2 \neq 0$$

So P^{-1} exists

adj P

$$A^4 = \begin{bmatrix} -49 & -50 & -40 \\ 65 & 66 & 40 \\ 130 & 130 & 81 \end{bmatrix}$$

Show that the matrix $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 3 & 1 \\ 0 & 0 & 1 \end{bmatrix}$ is not diagonalisable.

Soln:-

Given matrix is $A = \begin{bmatrix} 1 & 2 & 3 \\ 0 & 3 & 1 \\ 0 & 0 & 1 \end{bmatrix}$

Since given matrix is triangular, the Eigen values are its diagonal elements.

$$\text{i.e. } \lambda = 1, 1, 3.$$

To find the Eigen vectors of A corresponding to Eigen values

Consider $(A - \lambda I)X = 0$ Here $\lambda = \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix}$

$$\text{or } \begin{bmatrix} 1-\lambda & 2 & 3 \\ 0 & 3-\lambda & 1 \\ 0 & 0 & 1-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{--- (1)}$$

$$\begin{bmatrix} 1 & -1 & 2 & 3 \\ 0 & 3 & -1 & 1 \\ 0 & 0 & 1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 2 & 3 \\ 0 & 2 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2: R_2 - R_1$$

$$\sim \begin{bmatrix} 0 & 2 & 3 \\ 0 & 0 & -2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$2x_2 + 3x_3 = 0 \quad \text{--- (2)}$$

$$-2x_3 = 0 \quad \text{--- (3)}$$

$$\Rightarrow \boxed{x_3 = 0}$$

$$\boxed{x_2 = 0}$$

$$\text{Let } x_1 = k$$

$$x = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} k \\ 0 \\ 0 \end{bmatrix} = k \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

$x = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ is the Eigen vector corresponding to $\lambda = 1$

The algebraic multiplicity of Eigen values $\lambda = 1$ is 2

and geometric multiplicity of Eigen value $\lambda = 1$ is 1

Since Algebraic multiplicity $\neq$ Geometric multiplicity

$\therefore$ The matrix cannot be diagonalizable.

NOTE:

if Eigen values are repeated, choose corresponding Eigen vectors that are linearly independent, so that $P^{-1}AP$ is diagonalizable.

Working rule:-

1. Diagonalization by orthogonal transformation is possible in the case of real symmetric matrices only
2. Let $A = [a_{ij}]_{n \times n}$ be a real symmetric matrix
 - (i) Find the Eigen values of A
 - (ii) if all the Eigen values of A are distinct then the corresponding Eigen vectors are linearly independent and pair wise orthogonal, the matrix is diagonalizable
 - (iii) For repeated Eigen values choose corresponding Eigen vectors are pair wise orthogonal.
 - (iv) The normalized Eigen vector given by $\frac{x_1}{\|x_1\|}, \frac{x_2}{\|x_2\|}, \dots, \frac{x_n}{\|x_n\|}$
 - (v) The modal matrix is $P = \left[\frac{x_1}{\|x_1\|}, \frac{x_2}{\|x_2\|}, \dots, \frac{x_n}{\|x_n\|} \right]$ then P will be an orthogonal matrix.
 - (vi) calculate $P^{-1} = P^T$
 - (vii) Find $P^{-1}AP = P^TAP = D$ which is diagonal matrix.

Find an orthogonal matrix that will diagonalize the real symmetric matrix $A = \begin{bmatrix} 3 & 0 & 0 \\ 0 & 3 & 1 \\ 0 & 1 & 3 \end{bmatrix}$. Also find the resulting diagonal matrix

Soln:

Given matrix is $A = \begin{bmatrix} 3 & 0 & 0 \\ 0 & 3 & 1 \\ 0 & 1 & 3 \end{bmatrix}$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} 3-\lambda & 0 & 0 \\ 0 & 3-\lambda & 1 \\ 0 & 1 & 3-\lambda \end{vmatrix} = 0$$

$$(3-\lambda) [(3-\lambda)^2 - 1] = 0$$

$$(3-\lambda) [\lambda^2 - 6\lambda + 8] = 0$$

$$(3-\lambda) (\lambda-2) (\lambda-4) = 0$$

$$\lambda = 2, 3, 4$$

Thus the Eigen values of A are $\lambda = 2, 3, 4$

To find the Eigen vectors of A corresponding to Eigen values

consider $(A - \lambda I)X = 0$ Here $X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$

$$\text{i.e. } \begin{bmatrix} 3-\lambda & 0 & 0 \\ 0 & 3-\lambda & 1 \\ 0 & 1 & 3-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{--- (1)}$$

Case (i) put $\lambda = 2$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_3: R_3 - R_2$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$x_2 + x_3 = 0$$

$$x_1 = 0$$

$$\text{let } x_3 = k$$

$$x_2 + k = 0$$

$$\Rightarrow x_2 = -k$$

$$X_1 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ -k \\ k \end{bmatrix} = k \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$$

$X_1 = \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$ is the Eigen vector corresponding to Eigen value $\lambda = 2$

$$\begin{bmatrix} 3-3 & 0 & 0 \\ 0 & 3-3 & 1 \\ 0 & 1 & 3-3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_1 \Rightarrow R_3 \quad \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$x_2 = 0$$

$$x_3 = 0$$

$$x_2 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 1K \\ 0 \\ 0 \end{bmatrix} = K \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \quad \text{let } x_1 = K$$

$x_2 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$ is the Eigen vector corresponding to Eigen value $\lambda = 3$

Case (ii)

$$\lambda = 4$$

$$\begin{bmatrix} -1 & 0 & 0 \\ 0 & -1 & 1 \\ 0 & 1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_1 \rightarrow (-1)R_1 \quad \begin{bmatrix} 1 & 0 & 0 \\ 0 & -1 & 1 \\ 0 & 1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2 \rightarrow (-1)R_2 \quad \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & 1 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_3: R_3 - R_2$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$x_1 = 0$$

$$x_2 - x_3 = 0$$

$$\text{let } x_3 = K$$

$$\therefore X_3 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ K \\ K \end{bmatrix} = K \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

$X_3 = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$ is the Eigenvector corresponding to Eigenvalue $\lambda = 4$

$$X_1^T X_2 = [0 \ -1 \ 1] \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} = 0$$

$$X_2^T X_3 = [1 \ 0 \ 0] \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} = 0$$

$$X_3^T X_1 = [0 \ 1 \ 1] \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} = 0 - 1 + 1 = 0$$

$\therefore X_1, X_2$ and X_3 are pairwise orthogonal

Normalize vectors are

$$X_1 = \frac{X_1}{\|X_1\|} = \frac{\begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}}{\sqrt{0+1+1}} = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ -\frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$X_1 = \begin{bmatrix} 0 \\ -\frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$X_2 = \frac{X_2}{\|X_2\|} = \frac{\begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}}{\sqrt{1+0+0}} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

$$\therefore X_2 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

$$X_3 = \frac{X_3}{\|X_3\|} = \frac{\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}}{\sqrt{0+1+1}} = \frac{\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}}{\sqrt{2}} = \begin{bmatrix} 0 \\ \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$\therefore X_3 = \begin{bmatrix} 0 \\ \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{bmatrix}$$

Modal matrix

$$P = \left[\frac{X_1}{\|X_1\|} \quad \frac{X_2}{\|X_2\|} \quad \frac{X_3}{\|X_3\|} \right]$$

$$P = \begin{bmatrix} 0 & 1 & 0 \\ -\frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$\begin{aligned}
 P^T &= P^{-1} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ 0 & \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix} \\
 P^T A P &= P^T A P = \begin{bmatrix} 0 & -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ 1 & 0 & 0 \\ 0 & \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix} \begin{bmatrix} 3 & 0 & 0 \\ 0 & 3 & 1 \\ 0 & 1 & 3 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 \\ -\frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \end{bmatrix} \\
 &= \begin{bmatrix} 0 & -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ 1 & 0 & 0 \\ 0 & \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix} \begin{bmatrix} 0 & 3 & 0 \\ -\frac{2}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \\ \frac{2}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \end{bmatrix} \\
 &= \begin{bmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix} = D
 \end{aligned}$$

Determine the diagonal matrix orthogonally similar to the symmetric matrix $A = \begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$

Soln: Given matrix is $A = \begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$

Eigen values of A are $\lambda = 2, 2, 8$ and corresponding Eigen vectors are $x_1 = \begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix}$ $x_2 = \begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}$ $x_3 = \begin{bmatrix} -1 \\ 0 \\ 2 \end{bmatrix}$

Since $x_2^T x_3 \neq 0$

$\Rightarrow$ These two vectors x_2, x_3 are not orthogonal.

To choose another Eigen vector corresponding to $\lambda = 2$ and orthogonal to $x_3 = \begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}$

$\Rightarrow$ choose α, β such that $\alpha \begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix} + \beta \begin{bmatrix} -1 \\ 0 \\ 2 \end{bmatrix}$ is orthogonal to $\begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}$

$\Rightarrow \begin{bmatrix} \alpha - \beta \\ 2\alpha \\ 2\beta \end{bmatrix}$ is orthogonal to $\begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}$

$$\Rightarrow \beta = 5\alpha$$

The orthogonal vector to $\begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}$ is $\begin{bmatrix} -4\alpha \\ 2\alpha \\ 10\alpha \end{bmatrix} = 2\alpha \begin{bmatrix} -2 \\ 1 \\ 5 \end{bmatrix}$

Take $x_3 = \begin{bmatrix} 2 \\ 1 \\ 5 \end{bmatrix}$

$\therefore x_1 = \begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix}$ $x_2 = \begin{bmatrix} 1 \\ 2 \\ 0 \end{bmatrix}$ and $x_3 = \begin{bmatrix} 2 \\ 1 \\ 5 \end{bmatrix}$ are the

required Eigen vectors.

Normalizing we get $P = \begin{bmatrix} \frac{2}{\sqrt{6}} & \frac{1}{\sqrt{5}} & \frac{-2}{\sqrt{30}} \\ \frac{-1}{\sqrt{6}} & \frac{2}{\sqrt{5}} & \frac{1}{\sqrt{30}} \\ \frac{1}{\sqrt{6}} & 0 & \frac{5}{\sqrt{30}} \end{bmatrix}$

and $P^T = P^{-1} = \begin{bmatrix} \frac{2}{\sqrt{6}} & \frac{-1}{\sqrt{6}} & \frac{1}{\sqrt{6}} \\ \frac{1}{\sqrt{5}} & \frac{2}{\sqrt{5}} & 0 \\ \frac{-2}{\sqrt{30}} & \frac{1}{\sqrt{30}} & \frac{5}{\sqrt{30}} \end{bmatrix}$

$P^T A P = P^{-1} A P = \begin{bmatrix} 8 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{bmatrix} = D$

APPLICATIONS OF EIGEN VALUES AND EIGEN VECTORS

to find natural frequencies (Eigen values) and mode shapes (Eigen vectors)

Working procedure:

1. The matrices mass (m) and stiffness (K) are given for the given system of Equations

$$[m]\ddot{x} + [K]x = 0$$

Where $a = \ddot{x}$

2. write Eigen value matrix corresponding to the above system is $[K - \lambda m]x = 0$

- Write the corresponding characteristic Equation $|K - \lambda m| = 0$
4. Solve the above Equation for eigen values λ_i which are called natural frequencies
5. Find the eigen vector corresponding to each λ_i ($i = 1, 2, \dots, n$) which are called shapes.

Determine the natural frequencies and normal modes of vibrating system for which mass $m = \begin{bmatrix} 1 & 0 \\ 0 & 2 \end{bmatrix}$ and stiffness $K = \begin{bmatrix} 2 & 1 \\ 1 & 3 \end{bmatrix}$

Soln: Free vibrating system equation is $[m]\ddot{x} + [K]x = 0$

characteristic equation for the $[m]\ddot{x} + [K]x = 0$

$$\text{is } |K - \lambda m| = 0$$

$$= \begin{vmatrix} 2 - \lambda & 1 \\ 1 & 3 - 2\lambda \end{vmatrix} = 0$$

$$= (2 - \lambda)(3 - 2\lambda) - 1 = 0$$

$$= 6 - 4\lambda - 3\lambda + 2\lambda^2 - 1 = 0$$

$$= 2\lambda^2 - 7\lambda + 5 = 0$$

$$= 2\lambda^2 - 2\lambda - 5\lambda + 5 = 0$$

$$= 2\lambda(\lambda - 1) - 5(\lambda - 1) = 0$$

$$= (\lambda - 1)(2\lambda - 5) = 0$$

$$\Rightarrow \lambda = 1, \frac{5}{2} \text{ are natural frequencies}$$

Normal Modes

Case i, $\lambda = 1$

consider $(K - \lambda m)x = 0$

$$= \begin{bmatrix} 2 - 1 & 1 \\ 1 & 3 - 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$R_2: R_2 - R_1$

$$\begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Taking $x_2 = 1$

$$x_1 + 1 = 0 \Rightarrow x_1 = -1$$

$$X_1 = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \end{bmatrix} = 1 \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

$X_1 = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$ is the Eigen vector corresponding to $\lambda = 1$.

Normal mode at $\lambda = 1$ is $\begin{bmatrix} -1 \\ 1 \end{bmatrix}$

Case ii,

$$\lambda = \frac{5}{2}$$

$$\begin{bmatrix} 2 - \frac{5}{2} & 1 \\ 1 & 3 - 2(\frac{5}{2}) \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -\frac{1}{2} & 1 \\ 1 & -2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$R_1 \leftrightarrow R_2 \quad \begin{bmatrix} 1 & -2 \\ -\frac{1}{2} & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$R_2: R_2 + \frac{1}{2}R_1 \quad \begin{bmatrix} 1 & -2 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$x_1 - 2x_2 = 0$$

Let $x_2 = 1$

$$x_1 - 2(1) = 0 \Rightarrow x_1 = 2$$

$$X_2 = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix} = 1 \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

$X_2 = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$ is the Eigen vector corresponding to $\lambda = \frac{5}{2}$

Normal mode at $\lambda = \frac{5}{2}$ is $X_2 = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$

Normal modes are $\begin{bmatrix} -1 \\ 1 \end{bmatrix}$ and $\begin{bmatrix} 2 \\ 1 \end{bmatrix}$

Quadratic form: A Second degree homogeneous polynomial in n variables $x_1, x_2, \dots, x_n$ is called a Quadratic form (Q.F)

- Eg: 1. $2x_1^2 + 4x_1x_2 - 3x_2^2$ is a Quadratic form in two variables x_1 and x_2
2. $x^2 + y^2 + z^2 - 2xy + 4yz - 2zx$ is a Quadratic form in three variables x, y and z .

General form of a Quadratic form in n variables is given by $Q = \sum_{i=1}^n \sum_{j=1}^n a_{ij} x_i x_j$

$$= [x_1, x_2, \dots, x_n] \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$$

$$= X^T A X$$

Where A is a real Symmetric matrix.

$\therefore$ Every real Quadratic form in n variables $x_1, x_2, \dots, x_n$ can be expressed in the form $X^T A X$.

MATRIX OF QUADRATIC FORM

A Quadratic form Q can be expressed as $Q = X^T A X$

The Symmetric matrix A is called the matrix Quadratic form.

Let the Quadratic form be $x_1^2 + x_2^2 + x_3^2 + x_1x_2 + x_2x_3 + x_3x_1$

Write the coefficients of

	x_1	x_2	x_3
x_1	x_1^2	$\frac{x_1x_2}{2}$	$\frac{x_1x_3}{2}$
x_2	$\frac{x_1x_2}{2}$	x_2^2	$\frac{x_2x_3}{2}$
x_3	$\frac{x_1x_3}{2}$	$\frac{x_2x_3}{2}$	x_3^2

Write the coefficients of square terms along the diagonal and divide the product terms x_1x_2, x_2x_3 and x_3x_1 by 2.

Find the symmetric matrix corresponding to the Quadratic form

$$x^2 + 2y^2 + 3z^2 + 4xy + 5yz + 6xz$$

Soln

		coefficients of		
		x	y	z
coefficients of	x	x^2	$\frac{xy}{2}$	$\frac{xz}{2}$
	y	$\frac{xy}{2}$	y^2	$\frac{yz}{2}$
	z	$\frac{xz}{2}$	$\frac{yz}{2}$	z^2

Let A be the Symmetric matrix of order 3 then

$$A = \begin{bmatrix} 1 & \frac{4}{2} & \frac{6}{2} \\ \frac{4}{2} & 2 & \frac{5}{2} \\ \frac{6}{2} & \frac{5}{2} & 3 \end{bmatrix}$$

$$= A = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 2 & \frac{5}{2} \\ 3 & \frac{5}{2} & 3 \end{bmatrix}$$

Find the Quadratic form corresponding to the matrix

$$\begin{bmatrix} 1 & 2 & -3 \\ 2 & -1 & 4 \\ -3 & 4 & 2 \end{bmatrix}$$

Soln: Let $A = \begin{bmatrix} 1 & 2 & -3 \\ 2 & -1 & 4 \\ -3 & 4 & 2 \end{bmatrix}$ which is a symmetric matrix of order 3.

$$\text{Let } X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} \text{ then } X^T = [x_1 \ x_2 \ x_3]$$

The Quadratic form of A is given by $X^T A X$

$$= [x_1 \ x_2 \ x_3] \begin{bmatrix} 1 & 2 & -3 \\ 2 & -1 & 4 \\ -3 & 4 & 2 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

$$= \begin{bmatrix} x_1 + 2x_2 - 3x_3 & 2x_1 - x_2 + 4x_3 & -3x_1 + 4x_2 + 2x_3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$$

$$= (x_1 + 2x_2 - 3x_3)x_1 + (2x_1 - x_2 + 4x_3)x_2 + (-3x_1 + 4x_2 + 2x_3)x_3$$

$$\Rightarrow x_1^2 - x_2^2 + 2x_3^2 + 4x_1x_2 - 6x_1x_3 + 8x_2x_3$$

LINEAR TRANSFORMATION OF A QUADRATIC FORM

Let $x^T A x$ be the Quadratic form in n variables $x_1, x_2, \dots, x_n$
 Let $x = P y$ be the linear transformation which transforms
 the variables $x_1, x_2, \dots, x_n$ to the variables $y_1, y_2, \dots, y_n$

$$\text{Now } x^T A x = (P y)^T A (P y)$$

$$= y^T P^T A P y$$

$$= y^T (P^T A P) y$$

$$= y^T D y \quad \text{where } P^T A P = D$$

$y^T D y$ is a Quadratic form in variables $y_1, y_2, \dots, y_n$

$\therefore y^T D y$ is the linear transformation of the Quadratic form $x^T A x$.

CANONICAL FORM OF A QUADRATIC FORM

Let $x^T A x$ be a Quadratic form in n variables, then
 there exists a real non-singular linear transformation
 $x = P y$ which transforms $x^T A x$ to another Quadratic form
 of type $y^T D y = \lambda_1 y_1^2 + \lambda_2 y_2^2 + \dots + \lambda_n y_n^2$ then $y^T D y$ is
 called the Canonical form (&) Sum of squares form of
 $x^T A x$. where $D = \text{dia}[\lambda_1, \lambda_2, \dots, \lambda_n]$ and $\lambda_1, \lambda_2, \dots, \lambda_n$ are
 the Eigen values of A

RANK, INDEX AND SIGNATURE OF QUADRATIC FORM

The given Quadratic form can be reduced to the
 Canonical form as $\lambda_1 y_1^2 + \lambda_2 y_2^2 + \dots + \lambda_n y_n^2$

RANK:

The number of non-zero terms in the Canonical form is called the rank of the Quadratic form. It is denoted by r .

The number of positive terms in canonical form is said to be Index of the Quadratic form. It is denoted by p

SIGNATURE

The difference between the positive and negative terms in the canonical form is said to be Signature of Quadratic form. It is denoted by S .

$$S = 2p - r$$

NATURE OF THE QUADRATIC FORMS

The Quadratic form X^TAX in n variables is said to be

- i) positive definite : If all the Eigen values of A are positive.
- ii, Negative definite : If all the Eigen values of A are negative.
- iii, positive Semi definite : if all the Eigen values of A are positive and atleast one Eigen value is zero.
- iv, Negative Semi definite : If all the Eigen values of A are negative and atleast one Eigen value is zero.
- (v) Indefinite : If some of the Eigen values of A are positive and some of the Eigen values of A are negative.

Soln:

Given Quadratic form is $x^2 + 3y^2 + 3z^2 - 2yz$

The matrix corresponding to Quadratic form is

$$A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & -1 \\ 0 & -1 & 3 \end{bmatrix}$$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} 1-\lambda & 0 & 0 \\ 0 & 3-\lambda & -1 \\ 0 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (1-\lambda) [(3-\lambda)^2 - 1] = 0$$

$$\Rightarrow (1-\lambda) [9 + \lambda^2 - 6\lambda - 1] = 0$$

$$\Rightarrow (1-\lambda) [\lambda^2 - 6\lambda + 8] = 0$$

$$\Rightarrow \lambda = 1, 2, 4$$

Since all the Eigen values of A are positive.

The nature of Q.F is positive definite.

Discuss the nature of the Quadratic form $2x^2 + 2y^2 + 2z^2 - 2xy - 2xz - 2yz$.

Soln:

Given Quadratic form is $2x^2 + 2y^2 + 2z^2 - 2xy - 2xz - 2yz$

The matrix corresponding to Quadratic form is

$$A = \begin{bmatrix} 2 & -1 & -1 \\ -1 & 2 & -1 \\ -1 & -1 & 2 \end{bmatrix}$$

The characteristic Equation of A is $|A - \lambda I| = 0$

$$\Rightarrow \begin{vmatrix} 2-\lambda & -1 & -1 \\ -1 & 2-\lambda & -1 \\ -1 & -1 & 2-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (2-\lambda) [(2-\lambda)^2 - 1] + 1[-2 + \lambda - 1] - 1[1 + 2 - \lambda] = 0$$

$$\Rightarrow (2-\lambda) [4 + \lambda^2 - 4\lambda - 1] + 1[\lambda - 3] - 1[3 - \lambda] = 0$$

$$\Rightarrow (2-\lambda) [\lambda^2 - 4\lambda + 3] + \lambda - 3 - 3 + \lambda = 0$$

$$\Rightarrow (2-\lambda)[(\lambda-1)(\lambda-3)] + 2\lambda - 6 = 0$$

$$\Rightarrow (2-\lambda)(\lambda-1)(\lambda-3) + 2(\lambda-3) = 0$$

$$\Rightarrow (\lambda-3)[(2-\lambda)(\lambda-1) + 2] = 0$$

$$\Rightarrow (\lambda-3)[2\lambda - 2 + \lambda^2 + \lambda + 2] = 0$$

$$\Rightarrow (\lambda-3)[- \lambda^2 + 3\lambda] = 0$$

$$\Rightarrow (\lambda-3) = 0 \quad \& \quad -\lambda^2 + 3\lambda = 0$$

$$\Rightarrow \lambda = 3 \quad (8) \quad -\lambda(\lambda-3) = 0$$

$$\Rightarrow \lambda = 0, 3$$

$$\therefore \lambda = 0, 3, 3$$

Thus the Eigen values of A are $\lambda = 0, 3, 3$

Since one Eigen value of A is zero and remaining are positive.

$\therefore$ The nature of the Q-F is Semi definite.

METHODS FOR REDUCING A QUADRATIC FORM TO

CANONICAL FORM

The following methods are used for reducing a Q-F to canonical form

- (1) Diagonalisation
- (2) Orthogonalisation
- (3) Lagrange's reduction.

METHOD: I DIAGONALISATION

Working rule:

- (1) write the matrix A of the given Q-F
- (2) write $A_n = I_n A I_n$
- (3) Apply row and column operation on Equation (1) to reduce A_n to a diagonal matrix
- (4) Apply the same row operations on pre-factor I on R.H.S and identical column operation on

⑤ By these operations, $A = IAI$ will be reduced to the form

$$D = P^T A P \text{ where } D \text{ is the diagonal matrix}$$

The canonical form is given by

$$Y^T D Y = \lambda_1 y_1^2 + \lambda_2 y_2^2 + \dots + \lambda_n y_n^2 \text{ where } D = \text{diag}[\lambda_1, \lambda_2, \dots, \lambda_n]$$

REDUCE the Quadratic form to the canonical form

$$x^2 + y^2 + 2z^2 - 2xy + 4zx + 4yz. \text{ Also find its rank, Index, Signature and nature.}$$

Soln: Given Quadratic form is $x^2 + y^2 + 2z^2 - 2xy + 4zx + 4yz$

The matrix form of the given Q.F is

$$A = \begin{bmatrix} 1 & -1 & 2 \\ -1 & 1 & 2 \\ 2 & 2 & 2 \end{bmatrix}$$

$$\text{write } A = I_3 A I_3$$

$$\begin{bmatrix} 1 & -1 & 2 \\ -1 & 1 & 2 \\ 2 & 2 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$R_2: R_2 + R_1; R_3: R_3 - 2R_1$$

$$\begin{bmatrix} 1 & -1 & 2 \\ 0 & 0 & 4 \\ 0 & 4 & -2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ -2 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$C_2: C_2 + C_1; C_3: C_3 - 2C_1$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 4 \\ 0 & 4 & -2 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ -2 & 0 & 1 \end{bmatrix} A \begin{bmatrix} 1 & 1 & -2 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$R_2 \leftrightarrow R_3$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 4 & -2 \\ 0 & 0 & 4 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} A \begin{bmatrix} 1 & 1 & -2 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$C_2 \leftrightarrow C_3$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & -2 & 4 \\ 0 & 4 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} A \begin{bmatrix} 1 & -2 & 1 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}$$

$$R_3: R_3 + 2R_2$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & -2 & 4 \\ 0 & 0 & 8 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 0 & 1 \\ -3 & 1 & 2 \end{bmatrix} A \begin{bmatrix} 1 & -2 & 1 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}$$

$C_3: C_3 + 2C_2$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & 8 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 0 & 1 \\ -3 & 1 & 2 \end{bmatrix} A \begin{bmatrix} 1 & -2 & -3 \\ 0 & 0 & 1 \\ 0 & 1 & 2 \end{bmatrix}$$

$\ddot{u} \quad D = P^T A P$

where $D = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & 8 \end{bmatrix}$ and $P = \begin{bmatrix} 1 & -2 & -3 \\ 0 & 0 & 1 \\ 0 & 1 & 2 \end{bmatrix}$

The canonical form to given Q.F is $-1/2 D T$.

$$= [y_1 y_2 y_3] \begin{bmatrix} 1 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & 8 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \\ y_3 \end{bmatrix}$$

$$= y_1^2 - 2y_2^2 + 8y_3^2$$

Rank (r) = 3

Index (p) = 2

Signature (s) = $2p - r = 2(2) - 3 = 4 - 3 = 1$

Nature of Q.F is indefinite.

METHOD 2 : ORTHOGONALISATION

Working rule :

- (1) Write the matrix A of Q.F
- (2) Find the Eigen values of A
- (3) Find the Eigen vectors of A corresponding to the Eigen values such that the Eigen vectors must be pairwise orthogonal.
- (4) Find the Normalized vectors $e_1 = \frac{x_1}{\|x_1\|}$, $e_2 = \frac{x_2}{\|x_2\|}$

--- $e_n = \frac{x_n}{\|x_n\|}$

- (5) Write the modal matrix $P = [e_1 e_2 \dots e_n]$

- (6) P being orthogonal matrix then $P^{-1} = P^T$

$\Rightarrow P^T A P = D$, where D is a diagonal matrix formed by Eigen values

(7) The canonical form is $y^T D y = \lambda_1 y_1^2 + \lambda_2 y_2^2 + \dots + \lambda_n y_n^2$

Reduce the quadratic form $3x^2 + 5y^2 + 3z^2 - 2yz + 2zx - 2xy$ to the Canonical form by orthogonal reduction and find the nature, rank, index and Signature.

Soln: Given Q.F is $3x^2 + 5y^2 + 3z^2 - 2yz + 2zx - 2xy$

The matrix form of the given Q.F is

$$A = \begin{bmatrix} 3 & -1 & 1 \\ -1 & 5 & -1 \\ 1 & -1 & 3 \end{bmatrix}$$

The Characteristic Equation of A is $|A - \lambda I| = 0$

$$= \begin{vmatrix} 3-\lambda & -1 & 1 \\ -1 & 5-\lambda & -1 \\ 1 & -1 & 3-\lambda \end{vmatrix} = 0$$

$$\Rightarrow (3-\lambda) [(5-\lambda)(3-\lambda) - 1] + 1[-3 + \lambda + 1] + 1[-5 + \lambda] = 0$$

$$\Rightarrow (3-\lambda) [\lambda^2 - 8\lambda + 14] + 1(\lambda - 2) + 1[\lambda - 4] = 0$$

$$\Rightarrow (3-\lambda) [\lambda^2 - 8\lambda + 14] + \lambda - 2 + \lambda - 4 = 0$$

$$\Rightarrow (3-\lambda) [\lambda^2 - 8\lambda + 14] + 2\lambda - 6 = 0$$

$$\Rightarrow (3-\lambda) [\lambda^2 - 8\lambda + 14] - 2[3-\lambda] = 0$$

$$\Rightarrow (3-\lambda) [\lambda^2 - 8\lambda + 14 - 2] = 0$$

$$\Rightarrow (3-\lambda) [\lambda^2 - 8\lambda + 12] = 0$$

$$\Rightarrow (3-\lambda) (\lambda - 6)(\lambda - 2) = 0$$

$$\Rightarrow \lambda = 2, 3, 6$$

The Eigen values of A are $\lambda = 2, 3, 6$

To find the Eigen vectors of A corresponding to Eigen values

Consider $(A - \lambda I)X = 0$ where $X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}$

$$\text{a. } \begin{bmatrix} 3-\lambda & -1 & 1 \\ -1 & 5-\lambda & -1 \\ 1 & -1 & 3-\lambda \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{--- (1)}$$

$$\begin{bmatrix} 1 & -1 & 1 \\ -1 & 3 & -1 \\ 1 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2: R_2 + R_1 ; R_3: R_3 - R_1$$

$$\begin{bmatrix} 1 & -1 & 1 \\ 0 & 2 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$2x_2 = 0 \Rightarrow x_2 = 0$$

$$x_1 - x_2 + x_3 = 0$$

$$\text{Let } x_3 = k$$

$$x_1 - 0 + k = 0$$

$$\Rightarrow x_1 = -k$$

$$X_1 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} -k \\ 0 \\ k \end{bmatrix} = k \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

$X_1 = \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$ is the Eigen vector corresponding to Eigen value $\lambda = 2$

Case ii, $\lambda = 3$

$$\begin{bmatrix} 0 & -1 & 1 \\ -1 & 2 & -1 \\ 1 & -1 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_1 \leftrightarrow R_3 \quad \begin{bmatrix} 1 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2: R_2 + R_1 \quad \begin{bmatrix} 1 & -1 & 0 \\ 0 & 1 & -1 \\ 0 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_3: R_3 + R_2 \quad \begin{bmatrix} 1 & -1 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$x_2 - x_3 = 0$$

$$x_1 - x_2 = 0$$

$$\text{let } x_3 = K$$

$$x_2 - K = 0$$

$$\Rightarrow x_2 = K$$

$$x_1 - K = 0$$

$$\Rightarrow x_1 = K$$

$$x_2 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} K \\ K \\ K \end{bmatrix} = K \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

$x_2 = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$ is the Eigen vector corresponding to $\lambda = 3$

case iii $\lambda = 6$

$$\begin{bmatrix} -3 & -1 & 1 \\ -1 & -1 & -1 \\ 1 & -1 & -3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_1 \Rightarrow R_3 \quad \begin{bmatrix} 1 & -1 & -3 \\ -1 & -1 & -1 \\ -3 & -1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2: R_2 + R_1; \quad R_3: R_3 + 3R_1$$

$$\begin{bmatrix} 1 & -1 & -3 \\ 0 & -2 & -4 \\ 0 & -4 & -8 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_2: \frac{R_2}{-2}$$

$$\begin{bmatrix} 1 & -1 & -3 \\ 0 & 1 & 2 \\ 0 & -4 & -8 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$R_3: R_3 + 4R_2$$

$$\begin{bmatrix} 1 & -1 & -3 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$x_1 - x_2 - 3x_3 = 0$$

$$x_2 + 2x_3 = 0$$

$$\text{let } x_3 = K$$

$$x_2 + 2K = 0$$

$$x_2 = -2K$$

$$x_1 + 2K - 3K = 0$$

$$x_1 - K = 0$$

$$x_1 = K$$

$$x_3 = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} K \\ -2K \\ K \end{bmatrix} = K \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix}$$

$x_3 = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$ is the Eigen vector corresponding to $\lambda = 6$

The Eigen vectors of A are

$$x_1 = \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}, x_2 = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}, x_3 = \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix}$$

We have $x_1^T x_2 = 0$; $x_2^T x_3 = 0$ and $x_3^T x_1 = 0$

$\therefore x_1, x_2$ and x_3 are pairwise orthogonal

Normalised Eigen vectors are

$$e_1 = \frac{x_1}{\|x_1\|} = \frac{\begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}}{\sqrt{2}} = \begin{bmatrix} -\frac{1}{\sqrt{2}} \\ 0 \\ \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$e_2 = \frac{x_2}{\|x_2\|} = \frac{\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}}{\sqrt{3}} = \begin{bmatrix} \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{3}} \end{bmatrix}$$

$$e_3 = \frac{x_3}{\|x_3\|} = \frac{\begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix}}{\sqrt{6}} = \begin{bmatrix} \frac{1}{\sqrt{6}} \\ -\frac{2}{\sqrt{6}} \\ \frac{1}{\sqrt{6}} \end{bmatrix}$$

Modal Matrix $P = [e_1 \ e_2 \ e_3]$

$$P = \begin{bmatrix} -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{6}} \\ 0 & \frac{1}{\sqrt{3}} & -\frac{2}{\sqrt{6}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{6}} \end{bmatrix} \Rightarrow P^T = \begin{bmatrix} \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{6}} & -\frac{2}{\sqrt{6}} & \frac{1}{\sqrt{6}} \end{bmatrix}$$

Since P is orthogonal matrix then $P^{-1} = P^T$

$$D = P^{-1}AP = P^TAP = \begin{bmatrix} -\frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{6}} & -\frac{2}{\sqrt{6}} & \frac{1}{\sqrt{6}} \end{bmatrix} \begin{bmatrix} 3 & -1 & 1 \\ -1 & 5 & -1 \\ 1 & -1 & 3 \end{bmatrix} \begin{bmatrix} -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{6}} \\ 0 & \frac{1}{\sqrt{3}} & -\frac{2}{\sqrt{6}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{6}} \end{bmatrix}$$

$$\begin{bmatrix} 2 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 6 \end{bmatrix}$$

The canonical form of given Q.F is $\bar{Y}^T D \bar{Y} = 2\bar{y}_1^2 + 3\bar{y}_2^2 + 6\bar{y}_3^2$

$$\text{Rank}(A) = 3$$

$$\text{Index}(P) = 3$$

$$\text{Signature}(S) = 2p - r = 2(3) - 3 = 3$$

The nature of Q.F is positive definite.

METHOD 3 LAGRANGE'S METHOD

Working rule:

Let $\bar{x}^T A \bar{x}$ be a Q.F of n variables

1. Take the common terms of given Q.F
2. Make perfect square suitable by regrouping the terms
3. Finally the resulting relation gives the required canonical form.

using Lagrange's method reduce the Q.F $\bar{x}^2 + 6\bar{y}^2 + 18\bar{z}^2 + 4\bar{x}\bar{y} + 8\bar{x}\bar{z} - 4\bar{y}\bar{z}$ to canonical form. Also find the nature, rank, index and signature of the Q.F.

Given Q.F is $\bar{x}^2 + 6\bar{y}^2 + 18\bar{z}^2 + 4\bar{x}\bar{y} + 8\bar{x}\bar{z} - 4\bar{y}\bar{z}$

$$= \bar{x}^2 + 4\bar{y}^2 + 2\bar{y}^2 + 16\bar{z}^2 + 2\bar{z}^2 + 4\bar{x}\bar{y} + 8\bar{x}\bar{z} - 4\bar{y}\bar{z}$$

$$= (\bar{x})^2 + (2\bar{y})^2 + (4\bar{z})^2 + 2 \cdot \bar{x} \cdot 2\bar{y} + 2 \cdot 2\bar{y} \cdot 4\bar{z} + 2 \cdot 4\bar{z} \cdot \bar{x}$$

$$+ 2\bar{y}^2 + 2\bar{z}^2 - 20\bar{y}\bar{z}$$

$$= (\bar{x} + 2\bar{y} + 4\bar{z})^2 + 2\bar{y}^2 - 20\bar{y}\bar{z} + 2\bar{z}^2$$

$$= (\bar{x} + 2\bar{y} + 4\bar{z})^2 + 2[\bar{y}^2 - 10\bar{y}\bar{z}] + 2\bar{z}^2$$

$$= (\bar{x} + 2\bar{y} + 4\bar{z})^2 + 2[\bar{y}^2 - 2 \cdot \bar{y} \cdot (5\bar{z}) + (5\bar{z})^2 - (5\bar{z})^2] + 2\bar{z}^2$$

$$= (\bar{x} + 2\bar{y} + 4\bar{z})^2 + 2[\bar{y}^2 - 2 \cdot \bar{y} \cdot (5\bar{z}) + (5\bar{z})^2] - 2 \cdot (25)\bar{z}^2 + 2\bar{z}^2$$

$$= (\bar{x} + 2\bar{y} + 4\bar{z})^2 + 2[(\bar{y} - 5\bar{z})^2] - 48\bar{z}^2$$

$$= \bar{y}_1^2 + 2\bar{y}_2^2 - 48\bar{y}_3^2 \text{ which is required canonical form}$$

Hence $\text{Rank}(r) = 3$

$\text{Index}(p) = 2$

$\text{Signature}(s) = 2p - r = 4 - 3 = 1$

The Nature of Q.F is indefinite.

using Lagrange's method, reduce that the Q.F

$x_1^2 + 4x_2^2 + x_3^2 - 4x_1x_2 + 2x_3x_1 - 4x_2x_3$. Also find its nature, index, rank and Signature.

Soln:

Given Q.F is $x_1^2 + 4x_2^2 + x_3^2 - 4x_1x_2 + 2x_3x_1 - 4x_2x_3$

$$= (x_1)^2 + (2x_2)^2 + (x_3)^2 - 2 \cdot x_1 \cdot 2x_2 + 2 \cdot 2x_2 \cdot x_3 + 2 \cdot x_3 \cdot x_1$$

$$= (x_1 - 2x_2 + x_3)^2$$

$$= y_1^2, \text{ which is required canonical form}$$

where $y_1 = x_1 - 2x_2 + x_3$

$\therefore \text{Rank}(r) = 1$

$\text{Index}(p) = 1$

$\text{Signature}(s) = 2p - r = 2 - 1 = 1$

The nature of the Q.F is positive semi definite.
