[5+5]

JAWAHARLAL NEHRU TECHNOLOGICAL UNIVERSITY HYDERABAD B.Tech II Year I Semester Examinations, November - 2015 DIGITAL LOGIC DESIGN

(Computer Science and Engineering)

Time: 3 Hours Max. Marks: 75

Note: This question paper contains two parts A and B.

Part A is compulsory which carries 25 marks. Answer all questions in Part A. Part B consists of 5 Units. Answer any one full question from each unit. Each question carries 10 marks and may have a, b, c as sub questions.

PART-A

1.a)	State and Prove De Morgan's Theorems.	[2M]
b)	Realize an XOR gate using universal gates.	[3M]
c)	Write about Sum of Products and Product of Sums of Boolean expressions.[2M]	
d)	Explain Steps of Simplification in Karnaugh maps with example.	[3M]
e)	Explain the working of Full adder with help of diagram.	[2M]
f)	Draw the logic diagram of a 3/8 decoder.	[3M]
g)	Construct Master-Slave J-K Flip-Flop.	[2M]
h)	Explain about Ripple counter.	[3M]
i)	Differentiate between SRAMs and DRAMs.	[2M]
j)	What is the difference between PLA and PAL?	[3M]

PART-B (50 Marks)

- Explain various number systems and Binary codes used in digital logic design 2.a) with examples.
 - Draw the logic diagram of the Boolean expression without simplifying b) $(A+B)(C+D)(\bar{A}+B+D).$

OR

- Explain the signed binary number representation and floating point number 3.a) representation with typical examples and discuss about their advantages.
- Convert $(AB+C)(B+\overline{CD})$ expression into sum of products and product of sums b) form. [5+5]
- 4.a) Realiaze the following function using basic gates.(Two-level). $f(x, y, z) = \sum (3,5,6,7)$
 - Simplify the Boolean function F together with don't care condition d, and then b) minterms: express the simplified function in some of $F(A,B,C.D) = \sum (0,2,5,7,11,15), d = \sum 3.4,6,12,13).$ [5+5]

OR

- Construct Karnaugh maps for three variable, four variable and five variable 5.a) Boolean functions and discuss their simplification methods.
 - Implement the following Boolean function using NAND gates and NOR gates b) after simplification using Karnaugh map method: F(A,B,C) = (0,1,2,3,6,7). [5+5]

www.FirstRanker.com

- Discuss with example how higher order Decoders are realized using low-order Decoders.
- Draw the logic diagrams of a 4 bit binary to gray and gray to binary code b) converter and verify its working with suitable examples. [5+5]

- Explain the functions of a De multiplexer and Encoder with necessary diagrams 7.a) and discuss their applications.
 - Construct logic diagram of a 4bit 2's complement adder for performing b) subtraction operation and verify its working by taking suitable examples. [5+5]
- Draw the circuit diagram of a 4 bit UP/DOWN binary counter and explain its 8.a) working with the help of its state diagram and truth table.
 - Design a 4 bit binary Ripple counter using T flip-flops and explain its working b) with help of state diagrams and truth table.

- Design a 4 bit universal shift register and explain its working with the help of its 9.a) state diagram and timing diagram.
 - Explain the working of synchronous sequential circuits and asynchronous b) sequential circuits with examples and mention their applications.
- Explain various types of memories and their construction and characteristics and 10.a) discuss the hierarchy of memory organization.
 - Implement the following two Boolean functions with a PLA $F_1(A, B, C) = \sum (0, 2, 4, 6)$

 $F_2(A, B, C) = \sum (0, 1, 6, 7).$

[5+5]

OR What is Cache memory? Explain the organization of cache memory with suitable 11.a) diagrams.

What is meant by memory decoding? Discuss the structure of address bus and **b**) data bus with suitable diagrams. [5+5]

---ooOoo---
