Code No: BP102T PCI SET - 1

I B. Pharmacy I Semester Regular Examinations, Jan/Feb - 2018 PHARMACEUTICAL ANALYSIS-I

Note: 1. Question Paper consists of three parts (Part-I, Part-II & Part-III) 2. Answer ALL Questions from Part-II 3. Answer any TWO Questions from Part-III 4. Answer any SEVEN Questions from Part-III 4. Answer any SEVEN Questions from Part-III PART —I (a) Silver chloride (b) silver nitrate (c) sodium chloride (d) sodium nitrate (ii) Due to poor calibration error arises. (a) Operational (b) Human (c) Personal(d) Instrumental (iii) Lewis proposed acid as species that can accept (a) Electron pair (b) Proton pair (c) Neutron (d) None of the above (iv) indicator method is used in redox titrations. (a) Internal (b) External (c) Self (d) All of above (v) For standardization of iodine is used. (a) Sodium carbonate. (b) Sodium sulphate. (c) Sodium thiosulphate. (d) Sodium molyblate (vi) The strength of the acids and bases depends upon (a) Degree of dissociation (b) Degree of saturation (c) both a & b (d) None of the above (vii) Reduction involves (a) loss of oxygen (b) gain in hydrogen (c) gain in oxygen (d) loss of electrons (viii) While Potassium Iodide (KI) is a powerful reducing agent, (a) iodide ion is oxidized to iodine (b) iodide ion is reduced to iodine (c) iodine is reduced to iodine (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (d) iodine iodide ion (d) oxidizes to lodine (l2), a change in color from colorless to (d) brown occurs (d) brown occurs (d) Both A and	Гim	e: 3 ho	PHARMACEUTICAL ANALYSIS-I urs Max. PART —I . (i) In argentometric titrations, titrant is	1111	e. 3 no	Note: 1. Question Paper consists of three parts (Part-I, Part-II & Part-III) 2. Answer ALL Questions from Part-I 3. Answer any TWO Questions from Part-II 4. Answer any SEVEN Questions from Part-III	KS. 73
(a) Silver chloride (b) silver nitrate (c) sodium chloride (d) sodium nitrate (ii) Due to poor calibration error arises. (a) Operational (b) Human (c) Personal(d) Instrumental (iii) Lewis proposed acid as species that can accept (a) Electron pair (b) Proton pair (c) Neutron (d) None of the above (iv) indicator method is used in redox titrations. (a) Internal (b) External (c) Self (d) All of above (v) For standardization of iodine is used. (a) Sodium carbonate. (b) Sodium sulphate. (c) Sodium thiosulphate. (d) Sodium molyblate (vi) The strength of the acids and bases depends upon (a) Degree of dissociation (b) Degree of saturation (c) both a & b (d) None of the above (vii) Reduction involves (a) loss of oxygen (b) gain in hydrogen (c) gain in oxygen (d) loss of electrons (viii) While Potassium Iodide (KI) is a powerful reducing agent, (a) iodide ion is reduced to iodine (b) iodide ion is reduced to iodine (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (d) iodine is oxidized to iodide ion (ix) While Iodide ion (I) oxidizes to Iodine (I ₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry				
(a) Operational (b) Human (c) Personal(d) Instrumental (iii) Lewis proposed acid as species that can accept	l.	(i)		(1M
(a) Electron pair (b) Proton pair (c) Neutron (d) None of the above (iv)		(ii)	Due to poor calibration error arises. (a) Operational (b) Human (c) Personal(d) Instrumental	(1M
(a) Internal (b) External (c) Self (d) All of above (v) For standardization of iodine is used. (a) Sodium carbonate. (b) Sodium sulphate. (c) Sodium thiosulphate. (d) Sodium molyblate (vi) The strength of the acids and bases depends upon (a) Degree of dissociation (b) Degree of saturation (c) both a & b (d) None of the above (vii) Reduction involves (a) loss of oxygen (b) gain in hydrogen (c) gain in oxygen (d) loss of electrons (viii) While Potassium Iodide (KI) is a powerful reducing agent, (a) iodide ion is oxidized to iodine (b) iodide ion is reduced to iodine (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (d) iodine is oxidized to iodide ion (ix) While Iodide ion (I) oxidizes to Iodine (I ₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (d) violet occurs (viii) Na Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry		(iii)		(1M
(a) Sodium carbonate. (c) Sodium thiosulphate. (d) Sodium molyblate (vi) The strength of the acids and bases depends upon		(iv)		(1M
(a) Degree of dissociation (b) Degree of saturation (c) both a & b (d) None of the above (vii) Reduction involves (a) loss of oxygen (b) gain in hydrogen (c) gain in oxygen (d) loss of electrons (viii) While Potassium Iodide (KI) is a powerful reducing agent, (a) iodide ion is oxidized to iodine (b) iodide ion is reduced to iodine (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (ix) While Iodide ion (I') oxidizes to Iodine (I ₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry		(v)	(a) Sodium carbonate. (b) Sodium sulphate.	(1 M
(a) loss of oxygen (b) gain in hydrogen (c) gain in oxygen (d) loss of electrons (viii) While Potassium Iodide (KI) is a powerful reducing agent, (a) iodide ion is oxidized to iodine (b) iodide ion is reduced to iodine (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (ix) While Iodide ion (I') oxidizes to Iodine (I ₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry		(vi)	(a) Degree of dissociation (b) Degree of saturation	(1M
(viii) While Potassium Iodide (KI) is a powerful reducing agent, (a) iodide ion is oxidized to iodine (b) iodide ion is reduced to iodine (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (ix) While Iodide ion (I) oxidizes to Iodine (I ₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry		(vii)		(1M
 (b) iodide ion is reduced to iodine (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (ix) While Iodide ion (Γ) oxidizes to Iodine (I₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry 		(viii)	While Potassium Iodide (KI) is a powerful reducing agent,	(1M
 (c) iodine is reduced to iodide ion (d) iodine is oxidized to iodide ion (ix) While Iodide ion (Γ) oxidizes to Iodine (I₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry 				
 (ix) While Iodide ion (Γ) oxidizes to Iodine (I₂), a change in color from colorless to (a) brown occurs (b) pink occurs (c) blue occurs (d) violet occurs (x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry 				
(x) In a Redox reaction, (a) oxidation occurs (b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry		(ix)	 While Iodide ion (Γ) oxidizes to Iodine (I₂), a change in color from colorless to (a) brown occurs (b) pink occurs 	(1M
(b) reduction occurs (c) neutralization occurs (d) Both A and B (xi) Basicity of organic acids can be determined by (a) Conductometry (b) Refractometry		(x)	In a Redox reaction,	(1M
(a) Conductometry (b) Refractometry		(xi)	(b) reduction occurs(c) neutralization occurs(d) Both A and B	(1N
		. ,	(a) Conductometry (b) Refractometry

SET - 1 PCI Code No: BP102T (xii) What would be the value of E_{cell} at equilibrium? (1M)(b) 0.34 V (c) 0.24 V (a) 0.58 V (d) 0.00 V (xiii) The straight line in the polarography curve in known as _ (1M)(a) migration current (b) residual current (c) limiting current (d) additional current The main disadvantage of dropping mercury electrode is _ (1M)(a) surface area drop (b) hg is toxic (c) diffusion current varies (d) variation in the applied voltage Which of the following does the saturated calomel electrode contains? (1M)(b) KCl (c) HgCl₂ (d) NaCl (a) AgCl Potentiometer is used in the determination of (xvi) (1M)(c) Strontium (d) Uranium (a) Ni (b) Thorium (xvii) In potentiometer, the current passing at the balancing point is ___ (1M)(a) Low (b) Medium (c) High (d) Zero (xviii) Which of the following is the ion sensitive electrode? (1M)(a) Hydrogen electrode (b) Saturated calomel electrode (d) silver-silver chloride (c) Antimony-antimony oxide electrode Phenolphthalein changes color in (xix) (1M)(a) Acids (b) Alkalis (c) Water (d) Salt solutions Number of moles of solute dissolved per dm³ of solution is (1M)(a) molality (b) percentage (c) concentration (d) molarity Give some account on type of errors and methods of their minimization. (5M)Write a note on Indian Pharmacopoea. (5M)What are gravimetric titrations? Classify them. Write in brief on precipitation (5M) gravimetry. b) Write the principle, procedure and applications of Fajan's method. (5M)4. a) How do you prepare and standardize 0.1N KMnO₄ solution? (5M)Write notes on Mixed indicators. (5M)**PART-III** Write a note on choice of indicator. (5M)Write a note on Co-precipitation and post-precipitation. (5M)Describe the titration curve for strong acid weak base. (5M)Explain the Henderson-Hasselbalch's equation for acidic buffer. (5M)Write in detail on the principle, procedure and uses of Volhard's method. (5M)Write a short note on Metal ion indicators used in complexometry. (5M)11. Write in brief on (i) accuracy (ii) Precision (5M)Write in detail on limit test for heavy metals. (5M)13. Write in detail on construction and working of Dropping mercury electrode. (5M)
