## Answer any FIVE Questions

All Questions carry equal marks

1. (a) What is solution pressure? Explain.
(b) A solution of sodium nitrate in water contains 1 kg of $\mathrm{NaNO}_{3}$ per 10 kg of water. Calculate the amount of ice formed in cooling 1000 kg of this solution to a temperature of $-15^{\circ} \mathrm{C}$. Concentration of saturated solution at $-15^{\circ} \mathrm{C}$ is given by 6.2 kmol of $\mathrm{NaNO}_{3}$ per 1000 kg of water. [4+12]
2. A large chamber contains dry $\mathrm{N}_{2}$ at $27^{\circ} \mathrm{C}$ and 101.3 kPa , water is injected in to the chamber. After saturation of the $\mathrm{N}_{2}$ with water vapor, the temperature in the chamber is $27^{0} \mathrm{C}$ :
(a) What is the pressure inside the chamber after saturation?
(b) How many moles of $\mathrm{H}_{2} \mathrm{O}$ per mole of $\mathrm{N}_{2}$ are present in the saturated mixture? [8+8]
3. Ammonia is made by the reaction between hydrogen and $\mathrm{N}_{2}$ according to the reaction
$\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightarrow 2 \mathrm{NH}_{3}$
If the reaction is carried out at 50 bar and 600 K , What volumes of nitrogen and $\mathrm{H}_{2}$ at these conditions are theoretically required for producing 1000 kg of ammonia and what will be the volume of $\mathrm{NH}_{3}$ produced at the reactor conditions. [16]
4. Dry air at 295 K and 100 kPa is bubbled through benzene. If the saturated air leaves at 300 K and 100 kPa ; how many kilograms of benzene are evaporated per $100 \mathrm{~m}^{3}$ of entering air. The vapour pressure of benzene (kPa.) is given by:
$1 \mathrm{nP}^{*}=13.885-\frac{2788.51}{\mathrm{~T}-52.36}$
5. Calculate the amount of heat needed to raise the temperature of 1 mol of a gaseous mixture containing $79 \% \mathrm{~N}_{2}$ and $21 \% \mathrm{O}_{2}$ by volume from 200 to $1200^{\circ} \mathrm{C}$.
$\mathrm{C}_{p}$ for $\mathrm{N}_{2}=6.457+1.389 \times 10^{-3} \mathrm{~T}-0.069 \times 10^{-6} \mathrm{~T}^{2}$
$\mathrm{C}_{p}$ for $\mathrm{O}_{2}=6.117+3.167 \times 10^{-3} \mathrm{~T}-1.005 \times 10^{-6} \mathrm{~T}^{2}$
Here $\mathrm{C}_{p}$ is in $\mathrm{Cal} /(\mathrm{mol} . \mathrm{K})$ and T is in K .
6. (a) A solution has a gravity of $100^{0}$ Twaddell. Calculate its specific gravity and its gravity in degrees Baume.
(b) An oil has a specific gravity at $60^{0} / 60^{\circ} \mathrm{F}$ of 0.790 . Calculate its gravity in degrees API and degrees Baume.
7. Molten sulfur at $140^{\circ} \mathrm{C}$ is burnt with $30 \%$ excess air at $120^{\circ} \mathrm{C}$ in a sulfur burner producing sulfur dioxide. Calculate the adiabatic reaction temperature using the following data:
Standard heat of reaction $=-70.96 \mathrm{kcal} / \mathrm{mol}$
Mean heat capacities in cal/mol.K :
$\mathrm{S}(\mathrm{l})=7.4$
$\mathrm{SO}_{2}(\mathrm{~g})=12.15$
$\mathrm{O}_{2}(\mathrm{~g})=7.14$
$\mathrm{N}_{2}(\mathrm{~g})=7.51$
Air $=7.00$
8. (a) To prepare a solution of $50 \%$ sulfuric acid, a dilute waste acid containing $25 \%$ $\mathrm{H}_{2} \mathrm{SO}_{4}$ is combined with a concentrated acid containing $90 \% \mathrm{H}_{2} \mathrm{SO}_{4}$. How many kg of the concentrated acid must be purchased for each 100 kg of dilute waste acid?
(b) A mixed acid containing $65 \% \mathrm{H}_{2} \mathrm{SO}_{4}, 20 \% \mathrm{HNO}_{3}$ and $15 \% \mathrm{H}_{2} \mathrm{O}$ is to be made by blending the following:
i. A spent acid containing $10 \% \mathrm{HNO}_{3}, 60 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ and $30 \% \mathrm{H}_{2} \mathrm{O}$.
ii. A concentrated nitric acid containing $92 \% \mathrm{HNO}_{3}$ and $8 \% \mathrm{H}_{2} \mathrm{O}$.
iii. A concentrated sulfuric acid containing $95 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ and $5 \% \mathrm{H}_{2} \mathrm{O}$.

All percentages are on weight basis. How many kg of each acid must be used to obtain 1700 kg of the mixed acid?
[8+8]
