# II B.Tech II Semester Examinations,APRIL 2011 <br> PROCESS HEAT TRANSFER <br> Chemical Engineering 

Time: 3 hours
Max Marks: 80

## Answer any FIVE Questions <br> All Questions carry equal marks

1. (a) What are the advantages and disadvantages of more number of passes on tube side and shell side of shell and tube heat - exchanger.
(b) Find out the length of the tube required for the following heat transfer where air is heated by exhaust gases. Q (heat transfer/hr) $=8000 \mathrm{Kcal}$. Inside $\left(D_{i}\right)$ and outside diameter $\left(D_{o}\right)$ of tube are 5 cm and 6 cm respectively. $\mathrm{H}_{\mathrm{i}}($ Inside heat transfer coefficient Air side $)=100 \mathrm{Kcal} / \mathrm{m}^{2} \mathrm{hr}{ }^{0} \mathrm{C}$ $\mathrm{h}_{\mathrm{o}}$ (out heat transfer coefficient gas side) $=160 \mathrm{Kcal} / \mathrm{m}^{2} \mathrm{hr}{ }^{0} \mathrm{C}$ $\mathrm{T}_{\mathrm{hi}}=400^{\circ} \mathrm{C} \mathrm{T}_{\mathrm{ho}}=150{ }^{\circ} \mathrm{C} \mathrm{T}_{\mathrm{ci}}=50{ }^{\circ} \mathrm{C} \mathrm{T}_{\mathrm{co}}=100^{\circ} \mathrm{C}$ Neglect the tube resistance and assume flow arrangement is parallel.
2. (a) Discuss the regimes of boiling heat transfer with the help of a boiling curve. Why is heat transfer coefficients lowered in film boiling as compared to nucleate boiling?
(b) What are the types of condensation? Which type is advantageous. $[11+5]$
3. A horizontal cylinder 0.025 m diameter and 0.5 m long is suspended in water at 20 ${ }^{0} \mathrm{C}$. Calculate the rate of heat transfer if the cylinder surface is at $60{ }^{\circ} \mathrm{C}$. Use the following correlation. $\mathrm{Nu}_{1}=0.53(\mathrm{Gr} \operatorname{Pr})^{0.25}$. Physical properties of water at the mean film temperature are : $\mathbb{K}=0.63 \mathrm{w} / \mathrm{m}{ }^{0} \mathrm{~K} ;$ Viscosity $=2.35 \mathrm{~kg} / \mathrm{m} . \mathrm{h}$; Density $=992 \mathrm{~kg} / \mathrm{m}^{3} ; \operatorname{Pr}=4.3$.
4. Liquid Benzene at $75^{\circ} \mathrm{C}$ is to be cooled to $40^{\circ} \mathrm{C}$. Flow rate of Benzene is $1.45 \mathrm{~kg} / \mathrm{sec}$ while the cooling water flow rate is $0.95 \mathrm{~kg} / \mathrm{sec}$. cooling water is circulating through the tubes at a temperature of $15^{\circ} \mathrm{C}$. Calculate the heat transfer area required for
(a) single pass co-current and counter current flow H.E
(b) Multipass shell and tube heat exchanger.

Data available; specific heat of Benzene $=1760 \mathrm{~J} / \mathrm{kgk}$
specific heat of water $=4180 \mathrm{~J} / \mathrm{kg}^{\circ} \mathrm{k}$
LMTD correction factor $=0.94$.
5. (a) Derive an expression for steady state conduction through a wall of hollow sphere of inner radius $r_{1}$ and outer radius $r_{0}$, thermal conductivity ' $k$ ' the inside and outside surfaces of the wall are at constant temperatures $\mathrm{T}_{1}$ and $\mathrm{T}_{2}$. show that the mean area employ in the equation is equal to $\sqrt{A_{1} A_{0}}$
(b) A copper plate $\left(\mathrm{k}=372 \mathrm{w} / \mathrm{m}^{0} \mathrm{C}\right)$ is 3 mm thick. It is protected from corrosion by 2 mm thick layer of stainless steel $\left(\mathrm{k}=17 \mathrm{w} / \mathrm{m}^{0} \mathrm{C}\right)$ on both the sides. The temperatures of the two outer surfaces of steel are $400^{\circ} \mathrm{C}$ and $100^{\circ} \mathrm{C}$. calculate the temperature at the two interfaces.
6. A single effect evaporator is to concentrate $9070 \mathrm{~kg} / \mathrm{hr}$ of a $20 \%$ solution of NaOH to $60 \%$ solids. The gauge pressure of the steam is $1.5 \mathrm{kgf} / \mathrm{cm}^{2}$. The absolute pressure in the vapour space is 100 mm Hg . The feed temperature is $38^{\circ} \mathrm{C}$ and the overall heat transfer coefficient is $1220 \mathrm{Kcal} / \mathrm{m}^{2} \mathrm{hr}{ }^{0} \mathrm{C}\left(1420 \mathrm{~W} / \mathrm{m}^{0} 2 \mathrm{~K}\right)$. Calculate the steam consumption, economy and the heating surface required.
DATA: Boiling point of water at $100 \mathrm{~mm} \mathrm{Hg}=51^{\circ} \mathrm{C}$
Boiling point elevation $=56^{\circ} \mathrm{C}$
Enthalpy of feed at $38^{\circ} \mathrm{C}=30.6 \mathrm{Kcal} / \mathrm{Kg}$ Enthalpy of Thick Liquor $=156 \mathrm{Kcal} / \mathrm{Kg}$.
7. A gas at $-15^{0} \mathrm{C}$ flows over a flat plate maintained at $5{ }^{\circ} \mathrm{C}$. Free stream velocity of gas is $12.5 \mathrm{~m} / \mathrm{s}$. The length of the plate is 3.8 m . Calculate the average value of heat transfer coefficient with and without accounting for the laminar boundary layer. Properties of gas: Density $=1.247 \mathrm{~kg} / \mathrm{m}^{3}$; Specific heat $=1005 \mathrm{~J} / \mathrm{kg}{ }^{0} \mathrm{~K}$; thermal conductivity $=0.0251 \mathrm{w} / \mathrm{m}^{0} \mathrm{~K}$. Viscosity $=1.76 \times 10^{-5} \mathrm{~N}-\mathrm{s} / \mathrm{m}^{2}$.
8. Two large parallel planes having emissivitys of 0.4 and 0.6 are maintained at temperatures of 820 K and 420 K , respectively. A radiation shield having an emissivity of 0.06 on both sides is placed between the two planes. Calculate.
(a) the heat- transfer rate per unit area if the shield were not present
(b) the heat - transfer rate per unit area with the shield present.
